This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

WM. WOOD & CO., Publishers, 27 Great Jones Street, New York.

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachm.
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its present sale exceeds $100,000 per year at wholesale. Its almost universal adoption by the profession, as the above figures show, is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK's preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proven itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

NEW YORK, *April 6th*, 1875.

J. R. LEAMING, M.D.,
Attending Physician at St. Luke's Hospital.

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

J. H. TYNDALL, M.D.,
Physician at St. Francis' Hospital.

LEWIS A. SAYRE, M.D.,
Professor of Orthopœdic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

SOLUBLE PILLS AND GRANULES

PREPARED IN THE LABORATORY OF

W. H. Schieffelin & Co.,

170 & 172 William Street, New York.

PURITY IN COMPOSITION. SOLUBILITY IN COATING.
UNIFORMITY IN SIZE. PERFECTION IN FORM AND FINISH.

The marked increase during the past few years in the demand for Pills made in accordance with the U. S. Pharmacopœia, and other recognized formulas, induced us, some time since, to commence their manufacture in our own laboratory, and we are now furnishing Coated Pills, which, for beauty of finish, solubility, and general excellence, are unequaled.

We desire to call the attention of physicians and others to the following points:—

1. The best materials are used in their manufacture.
2. No article required by a formula is omitted on account of its high cost.
3. No Pills are deficient in weight.
4. The Pills are Coated while soft.
5. There is but one Coating which is perfectly soluble, and there is no sub-coating of resinous character.
6. The Coating is so thin that the Pills are not perceptibly increased in size, and yet it is entirely sufficient to protect the Pills from atmospheric influences; and effectually covers any nauseous taste, thus rendering the Pill easy to be swallowed.
7. The Coating is so transparent as to clearly reveal the color of the mass.
8. Their solubility is not impaired by age.
9. The various masses are so thoroughly worked that the materials are perfectly distributed.
10. The excipients are peculiarly adapted to the permanent solubility of the mass and its efficient therapeutic action.

Particular attention is called to our GRANULES of MORPHINE, STRYCHNINE, ARSENIOUS ACID, and other powerful remedies, which are prescribed in minute doses. The desirability of having these medicines in this shape, accurately weighed and ready for administering, has long been recognized. We have taken every precaution to insure accuracy in weight, and can give assurance that in this, as in other particulars, they can be implicitly relied upon. We offer the following:—

Arsenious Acid,	1-20, 1-30, 1-50 gr.	**Morphia Acetate,**	⅛ gr.
Calomel,	¼ gr.	**Morphia Sulphate,**	⅛, 1-10, 1-6 gr.
Corrosive Sublimate,	1-12, 1-20, 1-30, 1-40, 1-50 gr	**Morphia Valerianate,**	⅛ gr.
Extract Belladonna,	½, ¼ gr.	**Nux Vomica, Extract,**	½, ¼ gr.
Iodoform,	1 gr.	**Podophyllin,**	½, ¼, 1 gr.
Mercury, Bin-Iodide,	1-16 gr.	**Strychnia,**	1-20, 1-30, 1-40, 1-50 gr.
Mercury, Proto-Iodide	¼, ½, 1-5, 1-6 gr.	**Zinc Phosphide,**	1-12, 1-6, 1-4, ¼ gr.

Zinc Phosphide and Nux Vomica, { Zinc Phosphide, 1-10 gr. / Extract Nux Vomica, ¼ gr.

We are constantly adding to out list of Pills and Granules new remedial agents, as soon as their medicinal qualities are demonstrated. We have recently introduced the following:—Ergotin, 3 grs.; Extract Erythroxylon Coca, 1 gr. and 2 grs.; Salicylate Sodium, 2 grs. and 5 grs.; Extract Guarana, 3 grs.; and Extract Sumbul, 1 gr. Others will follow in due course.

We shall be happy to supply samples and price-lists upon application.

Private formulas of not less than 3,000 pills made up, and estimates furnished.

W. H. Schieffelin & Co.,

170 & 172 William Street, New York.

In corresponding with Advertisers please mention **The Medical Record.**

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For ***Headache,*** or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast.

and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

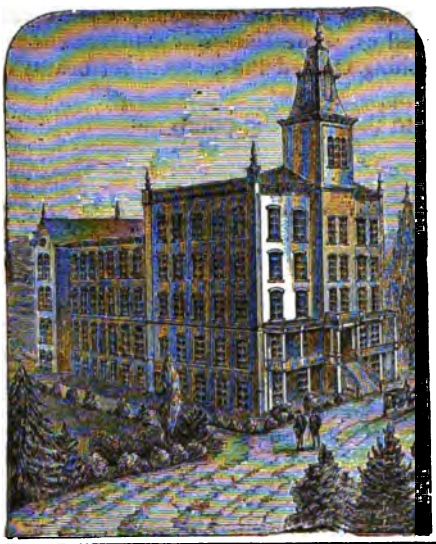
The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case.....$9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*
Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.,** or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.



THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.

INCORPORATED 1866.)

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors; billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton [L. I.], N. Y.

HANSEN'S
Wet Nurse Agency

Always **Uniform and Reliable.** (5 Prize Medals.)

WM. S. KIMBALL & CO.,
Peerless Tobacco Works, Rochester, N. Y.

McKESSON & ROBBINS'

Gelatine-Coated Pills and Granules.

We take occasion to thank the profession and trade for their patronage of our **GELATINE-COATED PILLS**, and request a continuance of the same. Full lines of our Pills have been established in all the large centres of trade, and in many of the smaller cities. To those living in remote places we will be happy to mail any formulas on our list, not procurable nearer home, upon receipt of price.

We regret to announce that our attention has been called to several instances where other pills have been substituted by druggists when ours were desired, and even specified, by the physician. We believe that such instances are rare, but in some cases physicians have notified us of such breach of honor in the druggist.

☞ **New additions to List. Send for full Price List of our Pills.**

McKESSON & ROBBINS' PILLS ARE SPHEROIDAL OR CAPSULE SHAPE. Specify McK. & R.

CHARCOAL (Willow) 5 grs.....60 per 100

The value of pure powdered Willow Charcoal in Dyspepsia, Indigestion, and all affections arising from derangements of the stomach, such as Headache, Heartburn, etc., is well known. Its use must necessarily be much increased, since it is, for the first time, presented in a convenient, reliable, and unobjectionable form in our Gelatine-coated Pills.

EXTRACT CANABIS INDICA, ¼ gr. $1.25 per 100.

This important extract is manufactured in our own laboratory, and the pills, when cut, exhibit in a marked manner, the distinctive color, taste, and odor of the freshly-made extract. We copy from the U. S. Dispensatory the following: "In morbid states of the system it (*Ext. Cannab. Indic.*) has been found to cause sleep, to allay spasms, to compose nervous inquietude, and to relieve pains: it differs from opium in not diminishing the appetite, checking the secretions, or constipating the bowels." "The complaints in which it has been specially recommended are neuralgia, gout, rheumatism, tetanus, hydrophobia, epidemic cholera, convulsions, chorea, hysteria, mental depression, delirium tremens, insanity, and uterine hemorrhage."

For doses, see U. S. Dispensatory.

SALICIN, 2½ and 5 grs.....$2.50 and $4.50 per 100.

Salicin is becoming more and more favorably known in the treatment of rheumatic affections; also as a tonic and antiperiodic, and is best exhibited in our Gelatine coated Pills.

In acute rheumatism, Salicin has been found very efficacious, and, according to *The Lancet*, "not less certain than Quinine, for ague." It has also been claimed, in large doses, to be an absolute specific in ulcerative choroiditis.

COCA EXTRACT, 1 gr. (McKesson & Robbins') $2.00 per 100.

The extract used in these pills is manufactured in our labaratory from fresh leaves. Coca is a South American plant, used by the natives as a substitute for tea, coffee, tobacco, hashish, and opium of other countries. It imparts vigor to the muscles as well as to the intellect, and enables the partaker to endure great fatigue with ease. The feeling of exhilaration accompanying its use is said not to be followed by any depressing effects.

Dose, 1 to 4.

JABORANDI EXTRACT, 3 grs..$3.00 per 100. (Made of McKesson and Robbins' Extract.)

These pills present a much better form of administering this powerful diaphoretic and sialagogue than any of the liquid preparations. Valuable in rheumatism and syphilitic troubles of long standing. Dose, 1 to 3.

SANDAL-WOOD EXTRACT, 1 and 2 grs. $2.00 and $3.00 per 100.

These pills contain both the oil and resin existing in sandal-wood, are believed to be superior to the oil alone, and are more convenient of administration. The extract is manufactured from the wood, in our laboratory.

SALICYLIC ACID with SULPHATE MORPHIA, ...$1.25 and $2.00 per 100.

Two sizes containing 2½ and 5 grains Salicylic Acid, united with 1-12 and ¼ grain Sul. Morphia respectively. Strongly recommended in Rheumatism, both acute and chronic.

QUINIDIA SULPH., 1, 2 and 3 grs., .80, $1.50, and $2.20 per 100.

CERIUM, OXALATE, 1 gr.. .... 1.00 per 100.

ALOIN, 1 gr..... 1.50 per 100.

SULPHIDE CALCIUM, 1-10 gr... 75 per 100.

CITRATE CAFFEIA, 1 gr..... 4.00 per 100.

FERROCYANIDE IRON, 3 grs.. 60 per 100.

DIALYSED IRON (Merck's scales) 2 grs. $1.25 per 100.

VALERIANATE of AMMONIUM, 1 gr. $1.00 per 100.

MONOBROMATED CAMPHOR, 2 and 3 grs. $1.50 and $2. per 100.

It is now being considerably used in treatment of Spermatorrhœa; strongly recommended in cases of Cerebral-Anæmia; used successfully in Infantile Convulsions from teething: Hysteria, Headache from over study or nervousness, and Nymphomania. Dose, 3 to 4 grains.

ERGOTIN PILLS, 3 grs.....$2.00 per 100.

We manufacture our Ergotin with great care from the best quality of fresh selected Ergot, and it contains in the most potent form all the active constituents of Ergot of Rye, each grain representing 10 grains of Ergot, and each pill being equal to half a teaspoonful of official fluid extract. The value of Ergotin in the place of the crude drug and the fluid preparations is conceded; and it is being largely administered both in this country and in Europe. It has taken a prominent place in the treatment of neurotic diseases. Many of our most reliable practitioners, and particularly those of extended experience in gynecology, assert that they have never found a preparation of Ergot, in which, by experience, they felt as much confidence as in McKesson & Robbins' Ergotin Pills. The advantages of prescribing it in this form will be readily acknowledged. Dose, 1 to 3.

We offer our Ergotin, prepared specially for hypodermic use in one ounce bottles, $1.50 per oz.

PHOSPHORUS, 1-100, 1-50, 1-20, 1-12 gr. $1.00 per 100.

The pure transparent Gelatine we use is in no degree porous, it preserves the Phosphorus perfectly in the free state. We have the Phosphorus in state of solution in the excipient we employ, this insures a gradual elimination of the Phosphorus in the stomach, thus avoiding the severe irritation that is so often experienced after taking the ordinary Phosphorus Pills, which are prepared by mixing the Phosphorus in substance with the excipient, in which small fragments of Phosphorus often remain. Note remarks by Dr. Squibb, in his paper before Am Pharm. Ass'n, Sept., '76, in which he states that Phosphorus should never be administered in substance, and if a coating be used, he commends Gelatine.

Many of the most eminent Physicians throughout the country, among whom are leading specialists in the treatment of Neurotic diseases, assert that McKesson & Robbins' Phosphorus Pills are the most rational medium yet found for exhibiting Phosphorus.

PHOSPHORUS COMPOUND, 1-50, 1-60, and 1-100 gr. ... .$1.25 per 100.

PHOSPHORUS COMPOUND AND IRON, $1.25 per 100.

Price Lists and Samples furnished upon application. Private formulas of 3,000 or more pills made and coated to order.

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists, 91 Fulton St., New York.

NOTE. In reply to inquiries in regard to CHANGE IN COLOR of our SULPHATE OF QUININE PILLS, we beg to state that the change is due to our using WHITE QUININE instead of UNBLEACHED, as formerly. With the purchase of our Patent for making GELATINE-COATED PILLS, there came into our hands the formula for using UNBLEACHED QUININE, which has been mostly imported, of the guaranteed standard of 90% Sulphate of Quinine, and the custom has been to employ 111 ounces of Unbleached Quinine, in place of 100 ounces of White Quinine. This change to White has been made to avoid misrepresentation.

Respectfully,

McKESSON & ROBBINS.

See Advertisement of McKESSON & ROBBINS' GRANULES, Gelatine-Coated, see No. 373, Page 1262.

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL, and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist.

INTERNATIONAL EXHIBITION AWARDS TO

Hance Brothers & White, Philadelphia.

In addition to the testimonials from eminent medical practitioners, which it has been our good fortune to present from time to time to the physicians and pharmaceutists of the country, we have now the pleasure of announcing **THREE AWARDS** from the Centennial Exhibition, as follows: One for the **Pharmaceutical and Chemical Products** of our house. One for **Hance's Drug Mill** (*the only premium given for Drug Mills*). One for **Hance's Non-Wasting, Percolating and Filtering Apparatus.**

The flattering verdict pronounced upon our exhibit by the medical and pharmaceutical visitors to the International Exhibition being confirmed by the *Bureau of Awards*, justifies the confidence that our efforts to supply *reliable preparations* are appreciated; and will certainly stimulate us to fresh exertions to maintain the reputation which we have established. Our highest ambition has been to secure the honor of being known as the manufacturers of THOROUGHLY RELIABLE PREPARATIONS, and our patrons may rest assured that no endeavor will be spared in our determination to deserve this confidence.

HANCE BROTHERS & WHITE, Pharmaceutical Chemists,

Catalogue of our manufactures mailed upon application.

Office:—Callowhill Street, Cor. of Marshall, Philadelphia.

PHOSPHORUS PILLS—PRICE REDUCED.

Believing that the present demand for Sugar-Coated Pills of Phosphorus and its combinations will justify a reduction of the price, Messrs. Allaire Woodward & Co. have modified their list on these pills, as follows:

Phosphorus,	1-100 gr. per 100	- - -	**40c.**
"	1-50 " "	- -	**40c.**
"	1-25 " "	- - -	**40c.**
Phosphorus Comp'd,	Phosphorus, 1-100 gr.; Ext. Nux. Vom., ½ "		**50c.**
"	**and Nux. Vom.**	Phosphorus, 1-50 "; Ext. Nux. Vom., ½ "	**50c.**
"	**Iron & Nx. Vm.**	Phosphorus, 1-100 "; Vallet's Mass 1 "; Ext. Nux. Vom. ½ "	**60c.**
Phos., Iron & Quinine,	Phosphorus, 1-100 gr.; Vallet's Mass, 1 "; Quinia Sul., 1 "		——
Phos., Iron, Nux & Quin.,	Phosphorus, 1-100 "; Vallet's Mass. 1 "; Ext. Nux. Vom. ½ "; Quinine, Sul., 1 "		——
Phosphide Zinc,	1-2 gr. per 100	- -	**$1 25**
"	1-4 " "	- -	**80**
"	1-8 " "	- -	**60**
"	**and Nux, each 1-8 gr.**	-	**60**
"	**Nux & Ext. Can'bis Ind. ea. 1-8 gr.**		**65**

The manufacturers feel confident that by their mode of manipulating the mass, *less of the objectionable effects* will be experienced by the patient, and *better results* obtained than by the use of any similar goods in the market. *Pills will be mailed to any part of the world upon receipt of list price.* Complete lists of Sugar-Coated Pills, Fluid and Solid Extracts mailed upon application.

ALLAIRE WOODWARD & CO., Peoria, Ill.

Pneumatic Aspiration

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

"I have thrust these needles into almost every part of the body; into the Joints, the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:

Fig. 68.

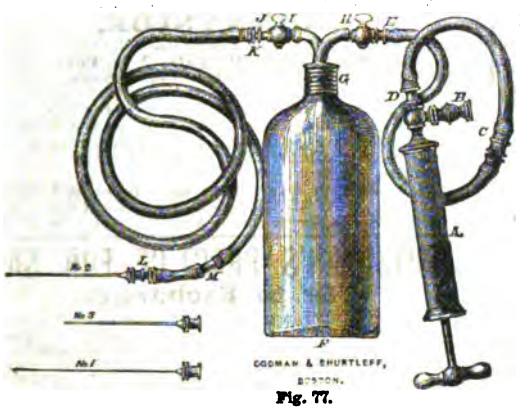

Fig. 77.

Fig. 78.

The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce healthy action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration.

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hematic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions..... $18 00

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78), to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions, 16 00

No. 3. Dieulafoy's Notched Aspirator, Nickel-plated, with two Needles, Tubes, etc., in case..... $14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional..... 6 00

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post-paid, by mail, on receipt of..... 3 40

☞ *Full description on application.*

An Illustrated Catalogue of Surgical Instruments, also a New Pamphlet on Atomization of Liquids, with description of Improved Apparatus and Formulæ of Remedies successfully employed, will be forwarded, post-paid, on application.

PHYSICIAN'S PRACTICE FOR SALE
Or to Exchange.

A Physician, located in a rapidly growing city, within an hour of San Francisco, Cal., would exchange with one having an equal practice in New York or vicinity, or would exchange for six months on trial. Business worth $6,000 per annum; house and furniture worth $12,000. Inquiries may be made of GEO. F. SHRADY, M.D., Editor of "Medical Record," or by addressing "MEDICAL EXCHANGE," care FRANK J. FRENCH, Esq., No. 528 California St., San Francisco, Cal.

The attention of the medical profession is invited to this instrument as the most perfect ever invented for treating Prolapsus Uteri, or falling of the Womb. It is an Abdominal and Uterine Supporter combined.

The Abdominal Support is a broad morocco leather belt with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen.

The Uterine Support is a cup and stem made of very highly polished hard rubber, very light and durable, shaped

to fit the mouth of the womb, with openings for the secretions to pass out, and which can be sent to any curve desired, by heating in very hot water.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, pass down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic, adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversion, or any Flexion of the Womb, and is used by the leading Physicians with never-failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price, with 16 cents added for postage; or by express C. O. D.

Dr. McINTOSH'S NATURAL UTERINE SUPPORTER CO., 296 West Lake Street, Chicago, Ill.

Our valuable pamphlet, "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

PURE COD-LIVER OIL.

Manufactured on the Sea-Shore by HAZARD & CASWELL, from Fresh and Selected Livers.

The universal demand for Cod-Liver Oil that can be depended upon as strictly pure and scientifically prepared having been long felt by the Medical Profession, we were induced to undertake its manufacture at the Fishing Stations, where the fish are brought to land every few hours, and the Livers, consequently, are in great perfection.

This Oil is manufactured by us on the sea-shore, with the greatest care, from fresh healthy Livers of the Cod only, without the aid of any chemicals, by the simplest possible process and lowest temperature by which the Oil can be separated from the cells of the Livers. It is nearly devoid of color, odor, and flavor—having a bland, fish-like, and, to most persons, not unpleasant taste. It is so sweet and pure that it can be retained by the stomach when other kinds fail, and patients soon become fond of it.

The secret of making good Cod-Liver Oil lies in the proper application of the proper degree of heat—too much or too little will seriously injure the quality. Great attention to cleanliness is absolutely necessary to produce sweet Cod-Liver Oil. The rancid Oil found in the market is the make of manufacturers who are careless about these matters.

Prof. PARKER, of New York, says: "I have tried almost every other manufacturer's Oil, and give yours the decided preference."

Prof. HAYS, State Assayer of Massachusetts, after a full analysis of it, says: "It is the best for foreign or domestic use."

After years of experimenting, the Medical Profession of Europe and America, who have studied the effects of different Cod-Liver Oils have unanimously decided the light straw-colored Cod-Liver Oil to be far superior to any of the brown Oils.

COD-LIVER OIL, with IODINE, PHOSPHORUS, and BROMINE.—This combination represents Phosphorus, Bromine, Iodine, and Cod-Liver Oil in a state of permanent combination, containing in each pint: Iodine, eight grains; Bromine, one grain; Phosphorus, one grain; Cod-Liver Oil, one pint.

COD-LIVER OIL, with PHOSPHATE OF LIME.—This is an agreeable emulsion, holding three grains Phosphate of Lime in each tablespoonful.

COD-LIVER OIL, with LACTO-PHOSPHATE OF LIME.

IODO-FERRATED COD-LIVER OIL.—This combination holds sixteen grains Iodide of Iron to the ounce of our pure Cod-Liver Oil

JUNIPER TAR SOAP.—Highly recommended by the celebrated ERASMUS WILSON, and has been found very serviceable in chronic eczema and diseases of the skin generally. It is invaluable for chapped hands and roughness of the skin caused by change of temperature. It is manufactured by ourselves from the purest materials, and is extensively and successfully prescribed by the most eminent physicians.

FLUID EXTRACT COCA.

NERVINE, STIMULANT. USED IN PERU and BOLIVA as a MASTICATORY.

This Extract contains the entire properties of the leaf of the **Erythroxylon Coca.**

COCA WINE.

This Wine has been successfully used in France as a **tonic,** and found very desirable where a more mild effect of the Coca than the Fluid Extract was desired.

SOLUTION FERROUS CHLORIDE.

This Solution of Iron is the lowest form of Chloride. It is much less Styptic in taste than Tr. Iron Chloride, consequently pleasanter to the patient; is much more easily assimilated by weak and irritable stomachs.

Knowing how difficult it is to introduce into the blood, in a proper form, a sufficient quantity of iron to be beneficial, we have manufactured and introduce the **Ferrous Chloride** as being easily absorbed and acting with much efficacy, even when given in small doses.

RELIABLE ANIMAL VACCINE.

The undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*
This Animal Vaccine can be obtained at CASWELL, HAZARD & Co's., Broadway, cor. 24th Street.

FRANK P. FOSTER, M.D.

We have an arrangement with Dr. Foster by which we receive this Vaccine ***fresh daily.***
By this arrangement all supplied by us is ***absolutely fresh.***
We can furnish it in any quantity desired, either by express, or by mail, if remittance is made to cover postage.
Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified indorsement of the medical profession of New York

INSTRUMENTS,

Anatomical Preparations,

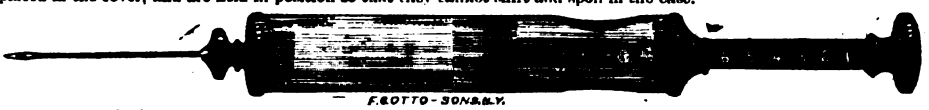
SKELETONS, &c.

Trusses, Abdominal Supporters, Elastic Stockings, &c., &c.

No instrument is used as often as the Hypodermic Syringe, and consequently they frequently get out of order. To furnish to the profession an instrument which can easily be kept in good working order, and which can be easily repaired, is our object of describing the following:

The instrument has two canulas of steel, either gilt or nickel-plated; will not oxidize; they are tempered, and have an easily-introduced lance-shaped point, which can be easily sharpened. The diameter of the canula is ¼ mm.

The Syringe is contained in a neat Hard Rubber case, the lower part of which holds the Syringe, and a vial of 5 grammes' capacity. The needles are placed in the cover, and are held in position so that they cannot shift and spoil in the case.



The advantages these Syringes possess over others may be briefly summoned as follows:

The construction of the cylinder out of hard rubber or glass, and the simple manner in which the different parts can be attached to another.

The construction of the stopple and the method of filling.

The manner in which the canulas are held in the case.

Dr. GAILLARD T. THOMAS, after examining the above instrument, pronounced the same to be one of the best improvements made in instruments since years.

Dr. G. R. PATTON, Lake City, Minn., writes: The Hypodermic Syringe came while I was away; I am pleased with it beyond expression.

PRICES.

The syringe with glass cylinder	$5 00
The syringe with glass cylinder, in a nickel-plated case, without a vial; very compact	3 50
The syringe with hard rubber cylinder	4 50

THE BEST THAT CAN BE PRODUCED

At Lowest Prices for Prompt Cash,

We are, therefore, fitting all our Physicians' vehicles and other fine carriages with

THE RUBBER CUSHIONED AXLE.

This great improvement secures the essential objects sought for in every vehicle, viz., **SAFETY, COMFORT,** and **ECONOMY,** and its use indisputably assuring these important and valuable qualities, it is now accepted as an

INDISPENSABLE FEATURE

in carriage building wherever **PERFECTION,** or a near approach to it, is sought to be attained.

Axles in use, where the arms are not much worn, can be altered, using the same wheels if the hubs are sound. Those at a distance may have the alterations made by sending us the axles and wheels only.

SEND FOR ILLUSTRATED CATALOGUE AND PRICE LIST.

☞ **HARNESS for PHYSICIANS' USE.** ☜

Please mention this Journal.

TO PHYSICIANS.

A large number of the profession in this and other cities now using the

RUBBER CUSHIONED AXLE,

And in some instances, for more than two years, accord it their unqualified endorsement as a means of obtaining relief from the discomfort and fatigue experienced when riding much, or at long distances.

Muffling noise and rattle, preventing violent dilation of the springs whereby **motion is lessened, decreasing vibration, jolting** and **pounding, economizing wear and tear** at every point, especially upon the wheels, reducing repair bills fully 50 per cent., renders this

APPROVED INVENTION

of the greatest value to all who would ride with **increased safety, absolute comfort, saving money** at the same time.

The improvement is simple in construction and easily applied. The expense is quite insignificant when compared with the gain, not only in largely increased durability of the vehicle, but in horse-power also, traction being reduced from 17 to 25 per cent.

Should your carriage builder be unfamiliar with the mechanical principle of "the axle," or the manner of its application, please send us his name and address, which will receive prompt attention.

By permission, we refer to the following well-known gentlemen now using the "Rubber Cushioned Axle," and, with two exceptions, for periods exceeding fifteen months:

Dr. Edward Bayard, 8 West 40th Street.

Printed Pills and Granules

These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the perfection of **accuracy**, and a **safeguard** against mistakes or substitution. Their claim to the confidence of the medical profession and pharmacist rests on the **entire purity of the ingredi nts used**; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal: Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

SOLE AGENTS FOR THE UNITED STATES.

LAZELL, MARSH & GARDINER'S,
POWDERED
MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weights* for the *Solid Medicinal Extracts.*

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz.		per oz.
Powd. Ext. Aconite Leaf	.40	Powd. Ext. Jalap	.40
Powd. Ext. Aloes	.40	Powd. Ext. Lobelia	.40
Powd. Ext. Belladonna	.50	Powd. Ext. Lettuce	.50

W. P. Worster, New York City.

BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end), ***20 cents***
*Seven " " " " " " ***$1.00.***
Crusts, each (Hermetically Sealed), ... ***2.00.***

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of information may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free.
A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases—such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

FOOD IS THE BEST TONIC!!

MENSMAN'S

PEPTONIZED

BEEF TONIC.

TRADE MARK.

The great necessity for a fluid food that would possess **all the elements necessary for the support of the system**, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and **semi-digested by aid of heat and pepsin**, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared for us by reliable and competent parties after a thoroughly tested and scientific method.

PROPRIETORS,

CASWELL, HAZARD & CO.,

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

Pullna Bitterwater.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

PRICE.—Case of 20 Pint Jugs.....$3.25 by
" Case of 50 Pint Jugs..... 8.00 "
Less discount according to quantity.

FOR SALE BY ALL DRUGGISTS.

Quotations for quantities may be had, as well as circulars, free from

P. SCHERER & CO.,

WARBURG'S TINCTURE.

Made from the original recipe of Dr. Warburg and used as a specific in malarious fevers and all diseases arising from malaria. This preparation is recommended by the English Government, and extensively used in all the English military hospitals, particularly in the East Indies. (see London *Lancet*, Nov. 13, 1875.)

Please specify, in ordering from any wholesale house, **Warburg's Tincture,** made by **F. A. REICHARDT.**

Price per bottle, 1 oz., **75c.**; per doz., **$5.00.** Per pint, **$5.00**; per doz., **$50.00.**

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynecologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. **$1.00** per dozen, sent by mail. Orders executed by return of mail.

F. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ½ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. **90c.** per dozen; **$10.00** per gross.

F. A. REICHARDT, Pharmacist,

404 Fourth Avenue, corner 28th Street, New York.

FEES.—Matriculation (payable each term), $5.00. Full Course (in advance), $75.00.

ALFRED MITCHELL, M.D., Secretary,
BRUNSWICK, ME.

Woman's Medical College of Pennsylvania.

THE TWENTY-EIGHTH WINTER SESSION

Will open on Thursday, October 4, 1877, in the commodious new College Building. Clinical instruction is given in the WOMAN'S HOSPITAL, Pennsylvania, *Wills*, *Philadelphia* and *Orthopædic Hospitals*. *Spring Course* of Lectures, Practical Demonstrations, and *Winter Quizzes* are free (except for expense of material) to all Matriculants of the year.

Address

RACHEL L. BODLEY, A.M., *Dean*,
North College Ave. and 21st Street, Philadelphia, Pa.

WANTED.

Those of our Subscribers who have received duplicate copies of No 323 and 361 of THE MEDICAL RECORD will greatly oblige the Publishers if they return them by mail to

WM. WOOD & CO., 27 Great Jones St., New York.

LONG ISLAND COLLEGE HOSPITAL, BROOKLYN, N. Y.

Annual Announcement and Circular, 1877-78.

The READING AND RECITATION TERM will commence October 4, 1877, and close February 14, 1878.
The REGULAR TERM will open March 5, 1878, and close the last week in June following.

FACULTY OF THE COLLEGE.

SAMUEL G. ARMOR, M.D., LL.D., Professor of the Practice of Medicine, and Dean.
GEORGE W. PLYMPTON, A.M., Professor of Chemistry.
JOSEPH H. RAYMOND, M.D., Professor of Physiology.
DANIEL AYRES, M.D., LL.D., Emeritus Professor of Surgery.
ALEXANDER J. C. SKENE, M.D., Professor Diseases of Women and Children.
EDWARD SEAMAN BUNKER, M.D., Professor of Obstetrics.
CORYDON L. FORD, M.D., Professor of Anatomy.
JARVIS S. WIGHT, M.D., Professor of Surgery, and Registrar.
JOHN D. RUSHMORE, M.D., Professor of Materia Medica.

THE CLINICAL ADVANTAGES OF THE LONG ISLAND COLLEGE HOSPITAL ARE UNSURPASSED IN THIS COUNTRY. For circulars, address DEAN or REGISTRAR.

POPULAR MEDICAL TEXT-BOOKS.

ANATOMICAL REMEMBRANCER; or, COMPLETE POCKET ANATOMIST. 18mo, muslin $1 00

BYFORD. A TREATISE ON THE THEORY AND PRACTICE OF OBSTETRICS. In one 8vo volume, muslin 4 50

CAZENAVE AND SCHEDEL ON DISEASES OF THE SKIN. Second edition, with notes by Dr. BULKLEY. 8vo, muslin .. 2 00

DAVIES ON THE PREPARATION AND MOUNTING OF MICROSCOPIC OBJECTS. 12mo, muslin 1 25

DELAFIELD. A TREATISE ON POST-MORTEM EXAMINATIONS. 8vo 3 50

FOX. SKIN DISEASES: THEIR DESCRIPTION, PATHOLOGY, DIAGNOSIS, AND TREATMENT. Handsome 8vo vol., illustrated, cloth 5 00

FREY ON MICROSCOPE AND MICROSCOPICAL TECHNOLOGY. 8vo, illustrated, cloth 6 00

GANOT'S TREATISE ON PHYSICS. New edition, very many illustrations, 8vo 5 00

GARROD'S ESSENTIALS OF MATERIA MEDICA. Revised to correspond to the U. S. Pharmacopœia. 8vo, muslin 4 00

GOULEY. CLINICAL LECTURES ON THE DISEASES OF THE GENITO-URINARY ORGANS AND THEIR TREATMENT. 8vo, illustrated 3 75

OWEN ON THE SKELETON AND TEETH. 12mo 75

PIFFARD. A GUIDE TO URINARY ANALYSIS. 8vo 1 25

STRICKER. MANUAL OF HUMAN AND COMPARATIVE HISTOLOGY. Translated by Drs. POWERS and BUCK. In one royal 8vo vol., profusely illustrated, cloth, $10.00; sheep, 11 00

VIDAL ON VENEREAL DISEASES. Edited by Dr. BLACKMAN. Third edition, 8vo, muslin 4 50

WOOD'S POCKET PRONOUNCING MEDICAL LEXICON. 64mo, roan leather, red edge, 75c; tucks, gilt edge 1 00

BENNETT'S LECTURES ON CLINICAL MEDICINE. Over 500 illustrations, fifth edition, 8vo, muslin, $6.00; leather .. $7 00

BEDFORD'S CLINICAL LECTURES ON DISEASES OF WOMEN AND CHILDREN. Eighth edition, 8vo, muslin, $4.00; leather 5 00

BEDFORD'S PRINCIPLES AND PRACTICE OF OBSTETRICS. Fourth edition, revised, plates and engravings, 8vo, muslin, $5 50; leather 6 50

COHEN ON THE DISEASES OF THE THROAT, LARYNX, &c. With their Diagnosis and Treatment. 8vo, illustrated. New edition in press.

FLINT (AUSTIN). COMPENDIUM OF PERCUSSION AND AUSCULTATION. 18mo, muslin 50

HAMILTON. A COMPLETE TREATISE ON SURGERY. In one royal 8vo vol., profusely illustrated, cloth, 7.00; sheep, 8 00

LOOMIS' PHYSICAL DIAGNOSIS. 8vo, illustrated 3 00

LOOMIS' LECTURES ON DISEASES OF THE RESPIRATORY ORGANS, HEART AND KIDNEYS. 8vo, cloth .. 5 00

LOOMIS' LECTURES ON FEVERS. 8vo, cloth, $4.00; sheep, 4 75

LYON'S HAND-BOOK OF HOSPITAL PRACTICE. 12mo ... 1 25

ROSCOE'S ELEMENTARY CHEMISTRY. 18mo, illustrated, muslin 1 50

ROOSA ON DISEASES OF THE EAR. 8vo, cloth 5 00

RINGER'S HAND-BOOK OF THERAPEUTICS. Sixth edition, 8vo, in press 4 25

STELLWAG ON THE ANATOMY AND DISEASES OF THE EYE. Colored plates and numerous illustrations, 8vo, muslin, $7.00; leather 8 00

WAGNER'S MANUAL OF GENERAL PATHOLOGY. 8vo, cloth, $5.50; sheep 6 50

WILSON (ERASMUS). THE STUDENT'S BOOK OF CUTANEOUS MEDICINE AND DISEASES. 8vo, muslin .. 3 50

Sent by mail on receipt of price.

TO PHYSICIANS.
THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving resules of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

An increase of 200 pages additional Reading Matter in a year will be made in

THE AMERICAN JOURNAL OF OBSTETRICS

And Diseases of Women and Children.

PAUL F. MUNDÉ, M.D., Editor.

In consequence of the great increase in the number of Subscribers to the AMERICAN JOURNAL OF OBSTETRICS the past year or two, the Publishers take pleasure in announcing that, beginning with January, 1878 (Vol. XI., No. 1.), they will permanently increase each number by *fifty additional pages*, thus giving its subscribers annually about

ONE-THIRD MORE READING MATTER

than heretofore, or, a volume of 896 large octavo pages with *no change in the subscription price.*

An increased number of illustrations, both wood engravings and lithographed plates, may also be expected in future volumes.

While the prosperity of the AMERICAN JOURNAL OF OBSTETRICS, and this consequent substantial evidence of it, cannot fail to be gratifying to all its subscribers and other friends, the Publishers trust the Medical Profession will take this voluntary action on their part as an earnest of their desire and intention, so far as in their power, to make all their publications merit the liberal support which is given them.

Subscription Price, $5.00 per year, invariably in advance.

☞ If any subscriber has a friend to whose notice he would like to commend the Journal, the Publishers will be pleased to mail a Specimen Copy to any address furnished them.

CONTENTS OF JANUARY NUMBER AMERICAN JOURNAL OF OBSTETRICS.

ORIGINAL COMMUNICATIONS.

I.—Remarks on the Obstetric Forceps, with a Description and Demonstration of Tarnier's New Instrument. By FORDYCE BARKER, M.D.

II.—Ovarian Dyspepsia. By J. MILNER FOTHERGILL, M.D., M.R.C.P., London.

III.—Observations on Pseudocyesis, and on Pregnancy in its Relation to Capital Punishment. By J. W. UNDERHILL, M.D., Cincinnati, O.

IV.—Impotency in Women. By ELY VAN DE WARKER, M.D., Syracuse, N. Y.

XX.—The Varioliform Diseases, Origin of Cow-pox and Intra uterine Vaccination. By O. BOLLINGER, Munich.

REVIEWS AND NOTICES OF BOOKS.

I.—The Question of Rest for Women during Menstruation. By MARY PUTNAM-JACOBI, M.D.

WM. WOOD & CO., Publishers, 27 Great Jones Street, New York.

TOTAL ABSTINENCE SAVING WINE TILL IT RIPENS.

There is a curious story about some native wines which are extensively advertised nowadays, and have only recently been put upon the market. Dr. Underhill, the well-known grape-grower of Croton Point, died in 1871. Some of his heirs entertained temperance views of such extreme kind, that they were unwilling to allow the stock of wines then on hand to be sold or any more to be made. The grapes have sometimes been sent to market, and sometimes left to decay upon the vines. It is only now that the other heirs have succeeded in arranging for a settlement of the estate and the sale of the wines on hand. Among these is a wine of the vintage of 1864, described as a "Sweet Union Port," but suggesting the Imperial Tokay more than any other European wine, and being wholly unlike any other wine of American growth. Its purity, age and mellowness are remarkable, and both physicians and wine-fanciers have a special interest in it as the oldest native wine now accessible in any considerable quantity. The whole stock is in the hands of the well-known wholesale grocery house of the Thurbers.—*N. Y. Tribune, Nov.* 19, 1877.

The above speaks for itself; but we would add that this is the pure juice of the grape, neither *drugged, liquored* nor *watered;* that it has been ripened and mellowed by age, and for medicinal or sacramental purposes, it is unsurpassed. It can be obtained from most of the leading Druggists throughout the United States, and at wholsesale from the undersigned, who will forward descriptive pamphlet, free of charge, on application.

Respectfully, etc.,

H. K. & F. B. THURBER & CO.,

West Broadway, Reade and Hudson Sts.,

NEW YORK.

MEDICATED DISCS
For Hypodermic Injection.

SPECIAL NOTICE.

Messrs. SAVORY & MOORE beg most respectfully to inform the MEDICAL PROFESSION generally, that the great demand which has arisen for their **GELATINE PREPARATIONS**, since they were first introduced, has compelled them to extend their Laboratory in New Bond Street, by the erection of a Department for the exclusive purification and manipulation of these articles. The discs for **HYPODERMIC INJECTIONS**, and for **OPHTHALMIC PURPOSES**, as well as the **LAMELS FOR INTERNAL USE**, will henceforth be prepared under the **immediate supervision of the Firm.** This Special Department is so arranged that the delicate process of manufacturing the Sheets of Gelatine cannot possibly be interfered with, and consequently the **perfect purity** and **accurate dosage** of these important and delicate preparations may be **THOROUGHLY RELIED ON.**

The HYPODERMIC DISCS are now sold in boxes, which have been found to be of greater advantage for their preservation than the leather wallets originally employed.

SAVORY & MOORE, 143 New Bond St., LONDON, ENGLAND.

SAVORY & MOORE

Beg to call the attention of the Profession to some of the Later Preparations brought out in England, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION.

Prepared in accordance with the direction of the Physician who introduced this Pure Drug as

A REMEDY for CONSUMPTION and WASTING DISEASES.

In the above-named diseases, or in cases where there is an unfortunate tendency to these distressing complaints, the introduction of fatty matter into the system, in some manner, is admitted by all Medical Authorities to be an **absolute necessity.** When Cod Liver Oil fails to increase weight, or cannot be tolerated by the stomach, Pancreatic Emulsion is the only remedy which can supply its place, and it may also be given in conjunction with the Oil, as it has the power of digesting it

PANCREATINE.

An almost tasteless powder, readily taken with water, milk, wine, etc. It possesses the active properties of the Pancreatic Juice, and is an important aid to the digestion and assimilation of starch, albuminoids, and fatty substances, such as Cod Liver Oil.

PEPTODYN, the New Digestive,

Is a combination of the whole of the digestive secretions, forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition. Peptodyn is intended as a general promoter of digestion for persons not necessarily considered in bad health; thus, when taken about a quarter of an hour after a meal, it will be found to assist digestion in a remarkable manner, and prevent the discomfort which often follows the partaking of a full meal by persons in good health.

AS SUPPLIED TO

THE ROYAL NURSERIES,

AND CONTAINING THE

Highest Amount of Nourishment

IN THE

MOST DIGESTIBLE AND CONVENIENT FORM.

This Food resembles Mother's Milk more closely than any other kind, perfectly fulfilling its object—that of promoting the **growth** and **health** of the Child.

DATURA TATULA, for Asthma,

HAY FEVER and **CHRONIC BRONCHITIS.** Recommended by the Profession as a remedy of great power and usefulness in cases of short and difficult breathing, spasmodic coughing, etc. Prepared in Cigarettes, and in the form of Tobacco; also Powder and Pastilles for Inhalation.

SAVORY & MOORE, 143 New Bond Street, LONDON, ENGLAND.

THE INVENTION OF AN EMINENT FRENCH CHEMIST.

To Physicians and the Public:

This preparation is, in composition, as advertised, principally the Gluten derived, by chemical process, from *very superior growths of wheat*, and should not be confounded with burnt or boiled Flour, in which the Gluten or sanative qualities are destroyed or made medicinally inert, nor with Crushed Wheat, or finely ground Wheaten Grits, styled "Medicinal Food," and sold under various names, in which the starch and impurities contained in wheat are retained in larger quantity.

By Dubisson's formula, the starch, impurities and soluble matter found in the Wheat Cereal are effectually excluded; the Gluten only retained, which is condensed, granulated and prepared to keep in all climates, and justly entitled

IMPERIAL GRANUM.

It is well known, and should be fairly considered, that nothing of merit can b *favorably received and commended by the public without being followed by* imitations of a questionable character. IMPERIAL GRANUM *is not the exception, for no* preparation *has* attracted more attention, *nor been more fiercely imitated, by competition*, even to wording and shipping order.

Whilst again it can be truly said that no preparation ever offered for sale has been more carefully prepared and thoroughly tested, nor has met with a more welcome reception and universal approval, or afforded more relief to invalids or to young and suffering children and aged persons. This has been confirmed by thousands of testimonials from Chemists, Physicians, Heads of Families and the Press.

Respectfully,
E. HEATON,
General Agent for the United States.

SOLD BY DRUGGISTS, AND PHARMACISTS, IN THE *PRINCIPAL CITIES OF THE UNITED STATES.*

JOHN CARLE & SONS, NEW YORK.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of **CASWELL, HAZARD & CO., New York,** and of all respectable Chemists throughout the world.

PHYSICIANS' RECORD-BOOK.

A short and concise method of keeping accounts of daily practice, by which a great amount of writing is saved.

By using this RECORD-BOOK, each individual's account, providing he receives one or more visits any day in the year, would occupy only

TWELVE LINES IN THE JOURNAL OR RECORD-BOOK,
AND
TWELVE ENTRIES IN THE LEDGER.

Full Size, 500 pages, ... **$5.50**
Half Size, 250 pages, ... **3.50**
Quarter Size, 125 pages, ... **2.50**

s above are cloth sides and morocco back and corners.

Quarter Size, paper covers, ... **$2.00**

men sheets of a new and improved Ledger will be sent on application.

BOUDAULT'S PEPSINE

[In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

DOCTOR CLIN'S

(Laureate of the Faculty of Medicine of Paris. Prix Monthyon.)

CAPSULES AND DRAGEES

Of Bromide of Camphor.

"These remedies are prescribed when it is necessary to produce an energetic sedation on the circulatory system, and particularly on the nervous cerebro-spinal system.

"They constitute one of the most energetic *anti-spasmodic* and *hypnotic* medicines."—*Gazette des Hopitaux.*

"*Dr. Clin's Capsules and Dragees of Bromide of Camphor* are those employed in all the experiments made in the hospitals of Paris."—*Union Medicale.*

Dr. Clin's Capsules contain 4 grains, and the Dragees 2 grains, of genuine Bromide of Camphor.

N.B.—*Dr. Clin's Gluten Capsules* are very rapidly dissolved in the stomach, and should be preferably employed for a long treatment, and when the administering of Bromide of Camphor at a great dose would be considered as beneficial.

Prepared by CLIN & CO., Pharmacists, Paris.

DUCRO'S ALIMENTARY ELIXIR,

A Combination Uniting the Properties of Alcoholic Stimulants and Raw Meat.

This preparation, which has been used with great success in the hospitals of Paris since 1868, is adapted to the treatment of all diseases requiring the administration, in a small volume, of a tonic able to stimulate and support the vital forces, as *Pulmonary Phthisis, Depression* and *Nervous Debility, Adynamia, Malarious Cachexia,* etc.

Prepared by DUCRO & CIE, Paris.

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, JR., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M. D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMITH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

Messrs. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

WARNER & CO.'S
SUGAR-COATED QUININE PILLS.

(With Twenty-Six Combinations.—See List.)

QUININE PILLS of our make are prepared from *Sulphate of Quinia* of American manufacture, noted for its purity and excellence. Each Pill contains the full complement of material as expressed on the label, without the necessity of adding any excess to compensate for impurities. They are perfectly soluble, and physicians can depend upon getting the full benefit of this valuable remedy in a pleasant form.

SUGAR-COATING, properly applied, does not impair the quality of such medicines as are commonly thus enclosed. *Dr. W. S. Edgar, Editor, says:*—"We procured a variety of W. R. WARNER & Co.'s preparations, and have prescribed them as opportunity offered, with *satisfactory evidence of their purity*, and reliability as to the quantity in each dose; also, we extract the following paragraph from a letter by a competent analytical chemist:"—

SUGAR-COATED QUININE PILLS.

"I take pleasure in testifying that W. R. WARNER & Co.'s QUININE PILLS are practically just what they claim to be, whether judged by analytical tests or by the therapeutic effect obtained from their use.

Original Lectures.

FRACTURE OF THE SHAFT OF THE FEMUR IN CHILDREN.

A LECTURE DELIVERED IN BELLEVUE HOSPITAL,

BY FRANK H. HAMILTON, M.D.

(Reported for THE MEDICAL RECORD.)

GENTLEMEN:—Having in my last lecture spoken of the fractures of the shaft of the femur in adults, I now come to speak of fractures of the shaft of the femur in children; that is to say, in persons under twelve or thirteen years of age.

In reference to the pathology of these accidents as occurring in adults or children, there are several points of difference. In adults the fractures are almost always oblique—very oblique; the line of fracture is relatively smooth, and the fragments overlap very much; while in children the fractures are often nearly transverse, denticulated, and not unfrequently, especially in very young children, only partially separated and not at all overlapped—in short, they are apt to partake more or less of the character of a "green stick" fracture. If overlapping occurs, it is usually to a limited extent, because the muscles have so much less power to cause displacement in this direction. The fragments are bent or thrown out of line easily, but there is little or no displacement in the line of the axis of the bone.

With these facts before us, we shall understand that the indications of treatment differ considerably in the case of the adult and of the child. Surgical writers have not sufficiently considered these differences, but they have generally said, or left it to be inferred, that the same plan of treatment was applicable to both, and that the prognosis did not differ essentially. I do not think so. The indications are, in fact, in some sense reversed. For while in adults the first and most difficult indication is to overcome the shortening occasioned by the obliquity of the fracture and the powerful action of the fully developed muscles, and the second is to keep the limb in line—here, in the case of children, the first and most difficult indication is to keep the limb in line, and the second is to overcome the action of the muscles, or this second indication may not be present at all.

Let us look at the usual modes of treatment of broken thighs in children, and see whether they are suited to these changed conditions.

The *double-inclined plane*, the thigh being flexed upon the body, shortens the already very short limb, and in many cases the plane of the splint does not support or take hold of the upper fragment at all. These fractures in children are generally near the middle; but even when they occur lower down, the space between the fracture and the groin is too short to allow the thigh-piece of the splint to give adequate support. All the lateral or coaptative splints are subject to the same objection in children, especially when the limb is flexed. I have tried these machines often in my earlier experience, and they gave me infinite trouble and disgust; they had to be readjusted daily, and if I got a good result it was a mere matter of accident.

The *plaster-of-paris* dressing, in which we put the limb always in the straight position, has also serious objections, especially in the case of infants. In proportion as the child is younger, the danger of strangulating the tissues and causing gangrene is greater; indeed, it is in children that most of these terrible accidents have happened from tight bandages. Their tissues are soft and yielding, and bandages of any kind, whether made of dry rollers, plaster-of-paris, paste-bandages, or anything else, applied with sufficient tightness to support the bones (which lie deep under these soft tissues), will be liable to cut off the venous or arterial circulation. The veins and arteries will feel the pressure before the bones do. For this reason they cannot be applied with sufficient firmness to give the requisite support. Besides this they are liable to the same objection, as in the case of adults, that the limb will shrink, and they will soon be loose and have to be renewed. They soon become soiled in the groin by the urine, and they become fouled by the fæces. Nor can any amount of ingenuity and care generally prevent this. The urine gets under the splint and causes excoriations of the delicate skin, and the little sufferers are in torment until it is removed.

The *straight position, with short side or coaptation splints, and the single long side splint, with pulleys and weights*, or such an apparatus as we have found best for adults, fails again in the case of infants and children. Imagine an infant three or four years of age, in an apparatus of this sort, with his left thigh broken. His right thigh and leg are free, and he can and will put it where he pleases. He will throw it over his broken leg, draw up his foot and roll himself over, and thrash about constantly, for there is nothing to prevent it, and this is the nature of a child. In doing this the fragments are constantly disturbed and a vicious union is likely to occur.

I believe we have found a better method than either of these—a remedy for most or all of these evils, in the apparatus which you now see before you, and which is the result of my own experience, aided by the occasional suggestions of my pupils.

This child with a fracture of the right femur is dressed as follows:

Dr. Hamilton's method.—Here are two long side splints, each about four inches wide and half an inch thick, extending from within two or three inches of the axillæ to four or five inches beyond the bottom of the feet. At the lower extremity these are united by a cross-bar, of such a length that when the splints are pressed against the sides of the body, they—the splints—shall be separated from each other farther at their lower than their upper extremities, by two or three inches. This is an arrangement suggested to me first by Dr. Frank H. Bosworth, while he was my house-surgeon, to prevent in some measure the child from wetting the dressings, by keeping the legs a little more asunder.

The two long side splints must be well padded to fit all the inequalities of the sides of the body and limbs. Thus prepared, this double splint is laid

upon the bed enclosing the body and legs of the child. The sound limb is now secured by successive turns of the roller, from the foot to the groin, to the corresponding long splint. Then the broken thigh is extended to its proper length, and the corresponding foot and leg are secured by a roller to the long side splint. It is better to do this before applying the short or coaptation splints to the thigh. Indeed, I sometimes omit these latter for a few days, or until the little patient has recovered in some measure from the bruises and swelling which is apt to accompany the fracture; but I will suppose you have found it proper to proceed at once to apply the coaptation splints, as they are applied in this case.

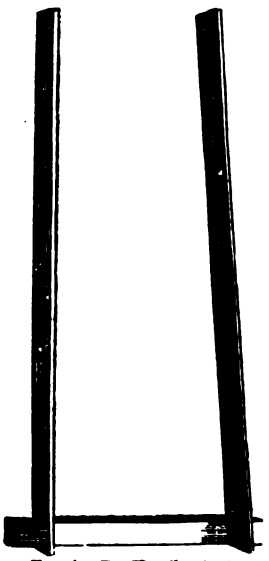

FIG. 1.—Dr. Hamilton's double thigh splint, for children.—*From Treatise on Surgery.*

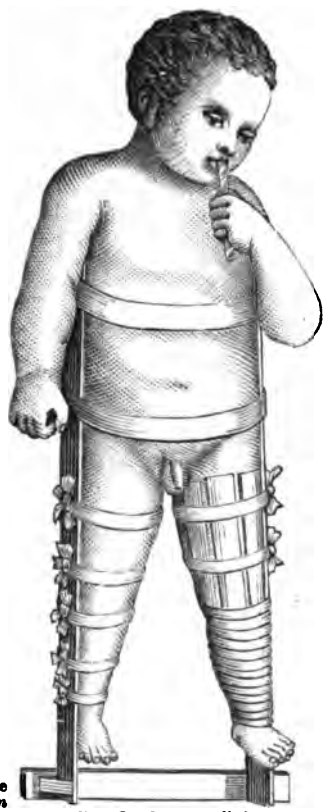

FIG. 2.—Same applied.

The coaptation splints, three of them, may be made of binders' board, thin pieces of wood—a shingle, for example, or of cloth felt, such as I have used during the last few months a good deal. This is not the felt made of woollen, of which I have spoken in my Treatise on Fractures, nor is it the felt manufactured from wool; but it is a material used by hatters to make the rims of a certain class of summer hats. It is made of cotton cloth, four or six thicknesses, and gum shellac.

I find it at the manufacturer's, Mr. J. M. Holley, No. 77 Greene St., in this city, already made, and it costs about two or three dollars a square yard, according to the thickness. It is capable of being moulded a little more than pasteboard, under the application of heat. For many purposes I like it very much.

The top splint, or front splint, must extend from the groin to half an inch from the patella. It never should touch the patella. The outside splint should extend from the top of the trochanter major to the external condyle, or lower if the fracture is low down, and the inside splint from the groin or near the groin to the internal condyle. Under each splint of felt or binders' board lay a piece of sheet lint a trifle larger than the splint, or a piece of woollen cloth. In the case of very young children I omit to sew a cover upon these splints, because they are apt to get soiled and need to be changed often. You have prepared three splints, one for the front, and one for each side; but you must not omit the fourth splint, which is the back splint. This must be firmer, wider, and longer than the others, and must be made of heavy sole-leather or of wood, or, if anything else is used, it must be firm. The limb is to rest on this as a sort of bed, and it ought to extend from just below the tuber ischii to three or four inches below the knee. It should be carefully padded to fit the inequalities of the limb, and covered with cotton cloth to keep the padding in place, and to fasten the circular bands to it. The upper end, for three or four inches, or more, may be covered with oiled silk. Now stitch the centre of six or seven strips of cotton cloth, each about one inch in width, to the back of this fourth splint, and put all the splints in their proper places, bring the strips to the front and tie them in bow knots, over the front splint. Do not include in these strips the long side splint. If you do there will be danger, when the body sinks upon the bed, that the thigh will bend at the point of fracture. In both my work on General Surgery and in my Treatise on Fractures, the broken thigh is shown as bound to the long side splint. A later experience has taught me that it is not always well to do so.

It remains for you, gentlemen, to pass a broad band around the body, near the top of the long side splints (including the splints), and another broad band under the nates, leaving a hole for defecation. The upper band keeps the child in the recumbent position, and supports his back when he is taken up. The lower one only supports the nates and thigh when he is taken up, and if fastened on each side (stitched) to the long splints, it need not pass in front of the body. You may have to change this occasionally.

For many cases the apparatus is now complete; but in most cases it is safer to employ a perineal band, carefully made, soft and flat, and which may be passed through either perineum—it is not very material which—and made fast to the top of the corresponding long splint. For this purpose you can fold a two-inch roller longitudinally, inclosing, where it passes through the perineum and under the nates, about six folds of paper, with a little cotton batting on the side to be laid against the skin. Stitch this properly, and before laying it against the perineum, protect the parts with a strip of sheet lint. The object of the folded paper is to prevent it from crumpling and making a sharp cord. This perineal band is to be kept only moderately tight, and may be loosened and changed as often as you please. I repeat that sometimes it is not needed.

You have now an arrangement by which you can keep the broken limb in a straight line and quiet, and in which you can remove the patient at any moment, and change the bed. You can, if you choose, take him out of doors.

In children five or six years of age, or older, if necessary, you can add to this extension by a pulley and weight, using about three pounds for a child of four years, and one additional pound for each additional year of life.

I have taken a great deal of pains, gentlemen, to

describe all the details of this dressing, because upon these details, in a great measure, your success will depend; and I repeat that, of all the various means I have tried, none have served me so well as this, and I have used this very often for a long time. My friends have been uniformly pleased with it, so far as I am informed, and Mr. Erichsen told me when in New York that it was used very satisfactorily in some of the London hospitals.

Don't omit, gentlemen, to look daily after the back splint, and see that it is in place.

Fortunately, these bones unite quickly (generally in three or four weeks); but it is prudent to keep on the apparatus five or six weeks, and not even then to allow the child to walk. If you follow my directions carefully, and take the proper pains—looking after your patient daily—you will always get straight legs, and in most cases there will be no perceptible shortening, and what little may occur will never cause the slightest halt in the gait. This has been my uniform experience since I began to use this dressing, and I have used it now for more than twenty years.

NOTE.—Dr. K. of this city has just informed me that he had occasion a short time since to assist Dr. W. in dressing a simple fracture of the thigh in a child three years old. The plaster-of-paris dressing was applied in the usual manner, and when removed, at the end of four weeks, the bone was found united, with a shortening of two and a half inches, and very crooked. During these four weeks it had been once removed and reapplied.

I venture to say that, with the plan of treatment described in my lecture, such a result would have been impossible. Indeed, I might almost say that such a result would have been impossible with any other plan of treatment than the plaster, or such as would conceal from the surgeon a knowledge of what was transpiring.

THORACENTESIS.

By CHARLES W. PACKARD, M.D.,

ATTENDING PHYSICIAN TO ST. LUKE'S HOSPITAL, N. Y.

THE operation of thoracentesis that now comes to us as something almost new, is as old as the time of Hippocrates; but it is only recently that it has been practised to any considerable extent. In fact, until Laennec's discovery of auscultation, it was impossible in a given case to determine the existence of fluid in the chest; and probably the operative procedure, before his day, consisted merely in opening into an effusion that was already pointing externally. About 1840, Trousseau brought the operation fairly before the medical world, and practised it in a large number of cases, and with a good degree of success; but the general voice of the profession on the Continent and in America united in denouncing it as dangerous and unwarrantable.

It was reserved for two American physicians to devise and perfect the present accepted operation of thoracentesis by aspiration. Dr. Henry I. Bowditch, of Boston, writes: "In 1850 occurred my first case, in which Dr. Morrill Wyman used the exploring trocar and canula with suction-pump attached, and which I immediately saw was the apparatus I had long sought for. That apparatus I have modified somewhat, so as to make it, I think, more convenient; but the principle of the instrument remains as suggested by Dr. Wyman." Twenty years after this date, Dr. Bowditch says, "I have tapped at least 250 times on 155 persons." Trousseau used a simple trocar, and made no special effort to keep air from entering the pleural cavity, while Bowditch's operation is an *aspiration*. As the results of this new operation have become known, it has grown in professional favor, until it is now accorded its place among the potent instrumentalities for the saving of health and life.

The following cases may serve as an illustration of some of the conditions under which the operation is indicated:

In April, 1869, I saw Mrs. ——, aged 48, who had been suffering from a pleuritis of the left side for about ten days, when she was suddenly seized with dyspnœa. The physician in attendance had diagnosticated the presence of an effusion some days before, but the patient had not been oppressed by it, and no special anxiety was felt in the case until the sudden attack of dyspnœa, accompanied with great anxiety.

She declared that she was dying, and so impressed her husband with this belief, that, although he was a very phlegmatic man, he would hardly wait to tell me that she had "a pleurisy, with water on the chest," and that he wanted me to see her with the doctor immediately. Putting a Bowditch's trocar in my pocket, I reached the patient within half an hour from the coming on of the seizure. She appeared to be dying. Her whole aspect was that of a *dying woman*. She was livid, cold, covered with sweat, gasping for breath; her pupils were dilated, and she was half unconscious from carbonic acid poisoning. I verily believe that she was in the article of death, as one is who is nearly drowned, but who may be rescued if instantly brought out of the water and into the air. Here was a woman drowning—not from being in water, but from having water in her; and, to continue the paradox, she was to be rescued, not by taking her out of the water, but by taking the water out of her!

The left pleural cavity seemed to be full of fluid; the indication for treatment was plain, and the necessity most urgent and instant. In a moment a trocar was thrust into the pleural cavity, in the axillary line, and between the sixth and seventh ribs. The patient did not seem to feel the puncture; but, as the serum flowed away, she began to regain her color, and before the operation was completed, she moved herself in her chair from her half-reclining posture, and sat bolt upright. Her pulse had returned, and her respirations grew regular and easy. The heart had been pushed over to the right side by the accumulated fluid, and as this was drawn off, it was interesting to watch the reducing dislocation, and also to follow the re-expanding lung. After 104 oz. had been removed, the instrument was withdrawn, and the patient expressed herself as being entirely relieved; and, in the reaction of feeling, she was almost jocose over her escape from impending death. The whole scene was to me most dramatic. In a recent letter to Dr. Bowditch, I narrated this case, and in reply he says: "As I look back now, and under the light of your case, I regret that I did not plunge a trocar into the side of a little child who had just ceased to breathe, and then restore the patient by artificial respiration." There seems to be no reason why such an effort at resuscitation may not be successful. After drowning, we try by artificial respiration to restore life, if we think there is a spark left that may happily kindle; and why not after drowning from pleuritic effusion of recent standing, where the lung has not been long compressed, and where adhesions have not had time to grow strong enough to hinder the ready expansion of the lung directly it feels the pressure of the inspired air? We can readily see how an intense pleuritis of long standing may cause an effusion and

exudation so great as to completely compress and tie up the lung, so that it cannot expand; but even then the withdrawal of the fluid may enable the heart to resume its normal position, and so straighten out the twists in the large blood-vessels. The mere dislocation of the heart must more or less impede the free passage of blood through its chambers and through the large vessels directly connected with it, and this fact, no doubt, offers an explanation of some of the cases of fatal syncope in pleurisy with large effusion. In this connection, it is well to remember that patients show a varying degree of tolerance in bearing cardiac displacements, as they do in bearing pleuritic effusions. I recall the case of a man who was steward of a vessel, and who had an enormous effusion on the left side. His heart was pushed over and upward until it beat at the third rib and on the line of the right nipple; and yet he had no dyspnœa to speak of, and was able to do his work. He refused to be aspirated, and walked away to resume his duties on shipboard. I warned him that he was in danger, but he felt so well he would not believe it. Experience has shown that no one is safe from a sudden and fatal syncope who is suffering from a pleurisy with effusion. I knew a young physician who was convalescent from pleurisy; the effusion was abating, the fever had left, and he felt so well that he insisted on exerting himself so far as to walk to the carriage that was to take him for a drive. He reached the carriage, but in trying to get in he faltered, and was dead before he could be carried into the house. An autopsy was made, but nothing disclosed except a moderately large effusion. How thorough the examination was I do not know, nor whether the heart and large vessels were examined *in situ*. Among the causes of sudden death as a result of large effusion, no doubt the displacement of the heart and pressure upon the large blood-vessels stand first. The normal axis of the heart may be so changed by the pressure as to have the apex point away to the right and upward towards the axilla. In such a case, all of the large vessels entering and leaving the heart must become so twisted as to more or less interfere with the direct currents of blood; and this may be disastrous in two ways. In the first place, the blood passing from the heart to the lungs to be aërated, is received and aërated almost entirely by one lung, the affected lung being so compressed that very little, if any, air enters the air-cells; and its blood-vessels are also so compressed that almost no blood finds its way through them. As a result, the sound lung has to do double duty, and deal with twice as much blood as it was equipped to do; hence, it becomes overtaxed and congested, and the patient is in constant danger of the supervention of œdema from congestion in the sound lung. The above state of things must always exist whenever there is enough effusion to compress the lung to any considerable extent. Now, add to this disturbed circulation in the sound lung another disturbed circulation in the large blood-vessels, so that the blood is sent to and received from the lung imperfectly and irregularly, and it is easy to see how vastly the danger of œdema is multiplied, and œdema of the sound lung under such circumstances may be a fatal complication, and is not unfrequently the direct cause of death.

But not only is there danger of death from œdema, but of fatal syncope from cutting off the current of blood on its way to the heart, and so imperfectly filling that organ with blood. Fraentzel states that the ascending vena cava, particularly "where it perforates the central tendon of the diaphragm to reach the pericardium, and where it is firmly attached to the margins of the quadrilateral foramen, may through the displacement of the heart suffer an almost rectangular twist." This author quotes several autopsies in which he has observed this condition. They all occurred in left-sided effusions, for reasons that are sufficiently apparent. These facts carry with them the practical lesson that patients with effusion must be kept from exertion or sudden movements of the body, which might drive the diaphragm upward, and thus still further compress the already twisted ascending vena cava, and so suddenly shut off the supply of blood to the heart.

The following case presents a somewhat rare history:

Margaret M., aged 24, Pa., married, of very stout habit, was admitted to St. Luke's Hospital, July 8, 1875, and gave the following history: she had enjoyed good health until six weeks before admission, when she was taken with a severe cold, accompanied with fever, cough, and pain in the right side. A physician visited her, and after examination said she had "a severe bronchitis." He continued in occasional attendance for three weeks, during most of which time she was so weak as to stay in bed; besides which, it "put her out of breath to move about." Suddenly, one night, and three weeks before she entered the hospital, she was seized with agonizing pain in the affected side, and instantly became unable to breathe. The family were summoned, and she was believed to be dying. She became cyanotic, but gradually the urgency of her symptoms subsided, and she was brought to the hospital. When I saw her she was evidently in a bad way. Her pulse was 125, R. 40, T. 105°. She was moderately cyanotic, and was constantly expectorating pus, pure and simple, and in immense quantities. It came up more as a regurgitation than as an expectoration, and in quantity amounted to pints—two or three—in twenty-four hours. It filled her bronchial tubes so fast that she was constantly coughing in order to free them, so that she could breathe. She had been discharging pus in this way for several days, and the constant necessity for expectoration had forbidden her to sleep day or night, and she dared not lie down for fear of suffocation. On inspection the right side was seen to be distinctly bulging and was somewhat œdematous, and she presented all the well-known signs of effusion. There could also be no doubt that this effusion was purulent; nor, considering the amount of pus expectorated, that somewhere there existed an open communication between this collection of pus and the bronchial tubes. It was also evident that the connection was a free one, for she pumped up the pus as if from a well.

On July 12th I passed the needle of a hypodermic syringe between the eighth and ninth ribs, on a line with the angle of the scapula, but got no fluid, owing to the thickness of the chest-wall. I then punctured at the same spot with a Bowditch's trocar, and drew off sixty-four oz. of laudable pus, thick, and of a greenish tinge; suddenly the pus stopped flowing, and air was pumped out instead. Upon putting my ear to the chest, I heard air rushing from the lung into the pleural cavity with a roaring and loud noise, which ceased as soon as the pleural cavity was filled with air. By my operation I had relieved my patient of more than a quart of pus, but air had taken its place, and she had a pneumopyothorax instead of a simple pyothorax. The air in the pleural cavity proved, however, to be a much quieter tenant than the pus, and for three days the patient was almost entirely relieved from her distressing and constant cough and expectoration. This gave her an opportunity to sleep,

and she also took some food with relish. On the morning of the fourth day the cough and expectoration had begun again, and were as great as ever. I had already determined that any further mere aspiration would be useless; for although by this operation she could be relieved of a part of the pus, still it could not all be pumped out, and the residue would soon become ichorous from contact with air in the pleural cavity, and prove an added source of irritation, and perhaps of septicæmia. In accordance with this view, and with the concurrence of my colleague, Dr. Jas. R. Leaming, who saw the case with me, I proceeded to make a free incision through the chest-wall, between the sixth and seventh ribs and in the axillary line. This location was selected because we judged that here the adhesions were less abundant than at the posterior part of the chest. After freezing the skin with ether-spray, I made an incision about 3½ inches long (it must be remembered that the patient was very fat), that carried me down to the intercostal muscles, through which I plunged a large-sized trocar; no pus followed. When withdrawing the stylet, I passed a probe through the canula and felt a thick carpeting of false membrane that the trocar had failed to penetrate. I then reintroduced the stylet and thrust the instrument deeper in, by a quick movement that served to drive it fairly into the collection of fluid. Pus now flowed freely, but the patient was seized with such a terrific fit of coughing that I withdrew the hard canula, and passed a large-sized soft rubber catheter in its place. Through this the pleural cavity was washed out with a weak solution of carbolic acid, and the catheter was retained in situ for forty-eight hours. The immediate result of the operation was to give almost entire relief from the cough. The pulse, temperature and respiration came down at once, and the patient was in a comfortable condition. The amount of pus secreted grew rapidly less, and on the fifth day after operation I found the house physician vainly trying to introduce the catheter in order to wash out the pleural cavity. On placing my ear to the chest the reason was apparent; the lung had expanded, and I heard a vesicular murmur clear to the base of the chest. The pleural surfaces, being thickly coated with tenacious and sticky exudation, were just in condition to fuse together and thus gum the expanded lung to its now normal position. I suppose that by this process the pleural cavity was nearly or quite obliterated. At any rate, no more pus was discharged, and at the end of two weeks the external incision had healed, and the patient was well. I think it is not claiming too much to say that she was *cured* by the operation. It is evident that at the beginning of her disease an error in diagnosis was made, and that an early thoracentesis might have saved her from pneumothorax and subsequent empyema. I believe the course of her disease to have been, first, a pleuritis with effusion that increased until, by pressure on the pulmonary pleura, some spot became necrosed and gave way, thus allowing air from the lung to find its way into the sero-fibrinous effusion, which then quickly degenerated into pus. It is probable also that the perforation in the pleura was over the lower part of the lung, and that as the pus was drawn off, it uncovered the aperture and allowed air from the lung to suddenly rush into the pleural cavity with the roaring noise already referred to. The pneumothorax was cured by the fibrinous exudation plastering up the rent in the pleura.

During the past year I have met with another instructive case of empyema, in a child seven years old, where, a few days after an aspiration of nine ounces of pus, a communication was formed between the pleural cavity and a bronchial tube, through which the empyema emptied itself. I had already notified the parents that another aspiration would be necessary, and that eventually a permanent opening in the chest-wall might be required. At this time the child had long been very ill with pain and hectic, accompanied with a most harassing cough, without expectoration. Suddenly, pus was expectorated in large quantities—two teacupfuls during a night; the cough, pain, and fever abated, and at the end of a week were entirely gone; the lung re-expanded, and the patient had cured herself. There was no evidence of pneumothorax. Indeed, it by no means follows that it is even most likely that the emptying of an empyema in this way will be accompanied with entrance of air into the pleural cavity. The pus oozes through the rent in the pulmonary pleura and finds its way through the pulmonary tissue, keeping its passage-ways to the bronchial tubes closed against the entrance of air by a series of little traps, kept constantly filled by the thick and on-moving pus.

The following history is one of empyema treated by aspiration and then by free incision, with subsequent washing out of the pleural cavity:

John H. D., aged 28, was admitted to hospital, April 8, 1876, under the care of Dr. Leaming. He stated that he had been very ill for about two months. Upon examination Dr. Leaming found a large effusion in the left pleural cavity, and aspirated on the following day, removing 72 oz. of laudable pus. The patient was much relieved by the operation, but the pus re-accumulated, and when I took the service, May 1st, three weeks after the aspiration, the side was again filled with pus; and it was thought best to make a permanent opening into the pleural cavity. An incision was accordingly made on a line with the angle of the scapula, and between the eighth and ninth ribs. No trocar was used, but the scalpel was carried directly through the intercostal space, making an opening about two inches in length. The pus spurted out and continued flowing until 100 oz. were evacuated. A piece of rubber tubing was then passed into the pleural cavity and secured in position by passing a thread through it, and then securing the thread to the skin by adhesive strips, and over this a large wad of oakum was placed to catch the discharges. The cavity was injected daily with a weak carbolized solution. Day by day the discharge of pus grew less, until it amounted to only one or two ounces in twenty-four hours. Still, however, for weeks the lung refused to expand, but remained bound by adhesions to the upper vertebral region, until it seemed as if it were imprisoned for life, when one day air was heard entering a few of the air-cells, enough to furnish a doubtful vesicular murmur; this increased until there was no longer any doubt, and at the end of another month expansion was almost entirely accomplished. The side, which had begun to fall in, filled out again, and the man considered himself well.

In both the cases treated by incision as above narrated, alarming symptoms occurred several days after operation, and when everything seemed to be going on well. In the case of the woman, the pulse suddenly ran up to 160, with other accompanying symptoms of collapse. In the man the condition was not so startling. In both, however, a more thorough washing out of the pleural cavity gave prompt relief, and rendered it probable that the injection had failed to reach some pockets in the false membranes that held offensive pus, which was poisoning the general system. Pus lying in the warm cavity of the pleura

and exposed to the air may rapidly decompose and thus become a source of irritation and septic influence. Hence, at the earliest indication that this change has taken place, it is essential that the pleural cavity be disinfected and washed out. This is easily done by turning the patient on the side, so that the incision is uppermost, and then allowing a stream of weak disinfecting fluid, at the temperature of the body, to slowly flow into the cavity. If the pus remains sweet in the early stages of treatment, I see no advantage in the use of injections; and it is reported that sudden death has followed their employment, though these instances must be rare. Later on, they may be made to afford a needed astringent or stimulant to the secreting surfaces.

In the operation by puncture, Dr. Bowditch advises that we "operate in the back, between the eighth and ninth, or ninth and tenth ribs, below the scapula, on a line with its lower angle. I auscultate the healthy side, and always tap at least two inches above the lowest point at which the murmur can be heard. Generally, I think between the eighth and ninth ribs is the best spot."

With this precaution the liver and diaphragm are not likely to be wounded. The trocar should be pushed in by a quick movement, and far enough to pass it through any false membrane that may happen to be deposited over the site selected for operation. The chest-walls are thinnest at the angle of the ribs, and here also the intercostal spaces are widest. Sometimes this latter consideration is of importance. In two cases where I have tapped, it was very difficult to insinuate the trocar between the ribs, which were drawn close together—in one case, I suppose by a contraction of the intercostal muscles, and in the other from a shrinking of the chest-wall. In the latter case I used the finest needle belonging to the aspirator, and entered it between the ribs with difficulty. This patient, a very nervous child, was under the influence of ether. As a rule, I should be opposed to the use of an anesthetic. For mere puncture—in an adult—it is entirely unnecessary, for the pain is almost nothing; and in the operation by incision, local anesthesia can be used. The administration of ether involves more or less struggling on the part of the patient, and it also hinders due aëration of the blood; and blood charged with carbonic acid is liable to coagulate and cause a thrombosis. Add to this danger of heart-clot, the already existing disturbed circulation through the heart and large vessels connected with it, and we have abundant reason to dread the effect of an anesthetic. The inhalation of ether must also cause a degree of congestion in the sound lung, and thus favor a state of œdema, which is a grave complication.

It still seems to be an open question whether the admission of pure air into the pleural cavity causes purulent inflammation. Air charged with infective germs certainly produces this result, as is seen in the case of a pneumothorax resulting from a necrosed spot in the visceral pleura, and where decomposed tissue-elements become an abundant source of infection; but a small quantity of air admitted during operation is not likely to have any ill effect, as has been proved in repeated instances where this accident has occurred. At the same time, common prudence would dictate that every precaution should be taken against the admission of air that, for aught we know, *may* carry with it infecting germs, and thus change a simple exudation into pus. For the operation by puncture, the best apparatus that I have seen is Bowditch's trocar with Davidson's syringe attached. The trocar is so small that it is readily pushed through the intercostal space, and yet its calibre is large enough to allow even thick fluids to readily flow through, while the syringe affords all the suction power that is needed or safe. As compared with Dieulafoy's aspirator, its operation is somewhat slow; but this is rather an advantage than otherwise, for it gives the displaced organs a little needed time in which to accommodate themselves to removal of the fluid that sustains them in their abnormal position. A *sudden* taking away of this support and removal of accustomed pressure upon the large blood-vessels involves danger of syncope.

As the fluid is withdrawn the lung descends and may come to press directly upon the end of the instrument. The visceral pleura rises and falls with the lung in respiration, and in this way is rubbed against the end of the canula. In such a case I conceive that harm may be done if the suction is so strong as to draw a portion of the pleura into the canula, which will then act like a mechanical leech, and so bruise tissues already lowered in vitality. If, instead of the smooth canula, the sharp lance-pointed *needle* of the aspirator has been employed, it is difficult to see how injury can be avoided. The cutting point of the needle is so sharp that slight pressure will cause it to penetrate not only the serous membrane, but also the lung itself, and as this viscus rises and falls upon the needle, its delicate tissues must sustain damage. In the case of the child already narrated, and where the ribs were so close together that I was obliged to use the small needle, and where a few days after aspiration pus was discharged through a perforation in the lung, I strongly suspect that this result was brought about by using the needle instead of the trocar.

The amount of fluid to be withdrawn must be regulated by each case for itself. Except in one instance, I took all I could get; in that case, after removing about 20 oz., the patient felt great oppression and constriction of the chest, and I desisted, thinking that perhaps a too rapid expansion of the lung might injure its delicate texture. Coincident with the introduction of the trocar, violent coughing usually takes place, that is variously accounted for. It is not unlikely that the wound of the costal pleura occasions it, and that the pulmonary pleura is also irritated by being stretched over the re-expanding lung. If the effusion is recent, the lung re-expands at once upon withdrawing the fluid that compressed it. If, however, time has been given for the formation of tough and strong false membrane, it may be tied up so that it cannot get free for a long time, or, as sometimes happens, not at all. In such a case the vacuum left below will be removed by the shrinking of the chest-wall upon that side, which will enclose a useless lung; and it is not necessary to speak of the constant peril in which a person lives who is deprived of half his breathing power. Here is a cogent reason for the early removal of a sero-fibrinous exudation. While it is entirely true that in the great majority of such cases nature brings about a cure, it is equally true that in many cases she does not; but leaves the lung permanently disabled; and in a crippled state, its circulation impeded, and more or less denied its natural stimulant of atmospheric air; the lung is in a most favorable condition to take on disease and run into a fatal phthisis.

It therefore becomes a serious question in any case, when the ordinary internal remedies have failed to bring about absorption, whether operative interference for the removal of the fluid is not called for. The time for interference must differ with differing cases.

A latent pleuritic effusion the result of a low grade of inflammatory action, and containing, very little fibrine, while all the more likely to degenerate into pus, will not make many or strong adhesions, and in this respect may be safely left for many weeks; but an acute pleurisy is a different thing, and I think that three weeks is the outside limit of safety against the formation of permanent and disastrous adhesions. In such a case, by drawing off even a part of the fluid, we diminish pressure upon the absorbents, and allow the lung to expand and to break the still tender bands of exudation that are threatening to permanently disable it.

Allow such a case to go a few weeks longer, and what were once tender, though perhaps thick exudations, have become as tough as wet chamois skin, and not very unlike in appearance. This too is becoming, or has become organized, and is an adventitious tissue, supplied with blood-vessels of its own, and past any hope of absorption. Interlacing bands run between the costal and pulmonary pleura, and if, by good fortune, a partial re-expansion is finally accomplished, it is after months or years of time, and at an expense of suffering and weakness of body that it is our duty to prevent.

In the case of an *empyema*, the demand for an operation is imperative, although even here it must be admitted that in certain rare instances nature is reported to have been able to dispose of the purulent fluid by absorption, and unassisted.

It is almost certain, however, that such a case, if left alone, will go on to a fatal issue, worn out by pain, and slowly consumed by hectic; or, unhappily, the patient may live long enough to become the subject of a thoracentesis by slow natural processes, by which the pus finds its way through the chest-wall, and imperfectly discharges itself through a fistulous opening. By the time this has been accomplished, the condition of the interior of the chest has become such that little can be hoped from this or any effort to completely relieve the cavity of its contained pus. If an attempt is made to enlarge the fistulous opening, it will be found that the pleural cavity is not only lined with false membrane, but that it appears to be almost filled with it. The membranous and organized bands or partitions, like guy-ropes running across from chest-wall to lung, and from lung to diaphragm, while hindering the expansion of the chest, also hinder the free discharge of the pus pocketed between them; so that a free opening at the most favorable site may fail to do more than empty that one of the loculi that it has directly encroached upon. So that, in fact, we have to deal not only with the external and accessible fistulous canal, but with many others opening into it that are internal and beyond the reach of operation. An attempt should be made to forestall this condition by an early tapping. By removing the fluid, we give the lung room to expand and thus break away from the plastic adhesions that are not yet strong enough to hold it, and it is among the possibilities that no re-accumulation of pus may take place. In such exceptionally favored cases it is supposed that the residual pus undergoes a fatty change, and is then reabsorbed. If repeated operations are necessary, it becomes a question whether aspiration should not give place to the operation by incision.

If the secretion of pus is steadily decreasing, and the constitutional disturbance is moderate, and especially in a young subject, we have reason to hope for an ultimate cure by aspiration. If, on the other hand, the pain and constitutional irritation continue severe, and the pus rapidly reaccumulates, I think there is no question that the pleural cavity should be opened by an incision large enough to admit of a ready evacuation of its contents, and of the manipulations necessary in washing it out, if the pus should prove to be of an irritating quality. This, of course, permits the free access of air to the thickened and inflamed serous membrane, but no harm results. May it not be that, so far as the contact with air produces any effect, it is beneficial by acting as a stimulant to the pyogenic surfaces. However this may be, the effect of the operation, so far as I have had opportunity to observe it, has been to diminish the amount of pus secreted, thus at once lessening the drain upon the system. The pain in the chest, which is often severe, is mitigated or entirely relieved, the cough abates, and under these improved conditions the patient is enabled to obtain natural sleep and to take food with increased appetite. Meanwhile, the lung is afforded room to expand, until, by its increasing bulk, it fills the cavity. It is obvious that the rate of this expansion will mainly depend upon the greater or less resistance offered by the adhesions, and to some degree also upon the inspiratory vigor of the patient.

LARGE MYXOMATOUS TUMOR OF BUTTOCKS—REMOVAL AND RECOVERY.

By L. L. COMSTOCK, M.D.,

CHARLESTON, WEST VIRGINIA.

The following case is presented on account of the great size of the tumor, its general character, its peculiar situation, and the rather remarkable absence of hemorrhage during the operation:

Mrs. Y. Age 38. Married. Four children, youngest 4, oldest, 11. Was married twelve years ago.

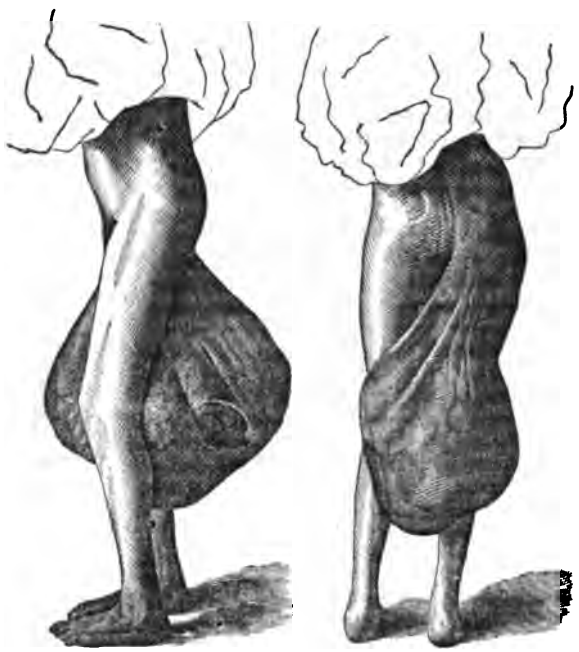
About fourteen years since was thrown from her horse, striking violently on her buttocks, leaving the right side somewhat painful and tender on pressure. About a year after this fall she discovered a small tumor issuing from between or through glutei muscles. This she could push back so that it would entirely disappear, but would speedily return on removal of pressure. Because of this one of her many doctors treated it for hernia. The tumor at this time, she said, was "right where I sit." At the time of her marriage it was about as large as a duck's egg, and had ceased to be either painful or tender on pressure. Very soon after marriage her husband discovered that something was wrong, and thinking himself imposed upon, returned her to the parental roof, but upon being convinced that it was the natural result of matrimony, or some other equally innocent cause, took her back to his own home a happier, if not a wiser man.

She soon became pregnant, and during this first pregnancy she thought the tumor grew more rapidly than ever before or since. From this time up to the time of removal, she thinks the growth of the tumor has been pretty uniform, though I am told it was nearly as large when her last child was born as now. This child was delivered with some difficulty, but was born alive. About this time a physician, being curious to know what the tumor contained, thrust a knife into it about eight inches; there was but small discharge—blood and bloody water—producing no pain whatever.

On July 1st, was called, in company with Dr. Parks, of Kanawha Salines, and Drs. Ewing and Carr, of Charleston, to see and remove the tumor—of which I had heard much, but had never seen—the patient declaring she would rather die than carry it any longer.

I found her sitting on a small bed, appearing somewhat careworn, and thin in flesh, but otherwise in perfect health; was of healthy parentage, and we had no reason to think that she had had syphilis. Had been regular in her menses until within the past three months; and she thought she was pregnant. As she sat, the tumor projected on both sides of right leg, extending nearly down to her feet. It was purplish in color. Skin generally smooth. The hair follicles, by constant tensions of the skin, were one and a fourth inch apart. In some places there were sharp depressions in the skin. As the tumor lay, a jar of the bed set it all in a quiver, like thin jelly. In some of the softer parts, or where the skin was the thinnest or softest, it felt as if filled with water.

Where it came against her legs most, and on under side, the skin seemed very thick—was almost perfectly devoid of sensation. She would slap it with her hand and pinch it without pain. In walking she reached down and grasped it as the fashionable lady does her train, and in this way she walked about considerably. She sat down upon it as if a cushion, throwing out her legs horizontally before her. She handled and pushed it about as if a perfectly foreign body, its size and weight being apparently the only inconvenience it gave her. About five years ago it ulcerated on its inferior and anterior surface, and has



discharged more or less ever since. Sometimes the discharge was pus from the ulcer, and at times a watery fluid. When the discharge was free it seemed to diminish in size. The ulcer was circular in form and about five inches in diameter. The tumor became pendulous soon after it emerged from muscles.

I took the following measurements as she sat: Circumference, three feet eleven inches. The upper portion extended above the general outline, and around it in this diagonal direction it was four feet three inches. The neck, not close to body, was one foot ten inches. Standing on her feet, the tumor hanging quite or nearly its whole weight—she could stand but a short time without support—it measured as follows: From point of origin to pubic bone, five feet; circumference, largest portion, four feet two inches, the neck being extended by weight of tumor; line drawn tightly, was one foot five inches.

While standing, the arms were drawn down on side of tumor four inches from her body. The right labia was also drawn down for some inches, forming a connection with the skin, a portion of the covering of the tumor being perceptible only from its color and smoother surface.

Etherizing our patient, we placed her on right side, flexing leg on thigh and thigh on abdomen. Made incision about four inches below anus—which brought a free flow of venous blood, more than in the whole operation besides, as only once or twice was there a spirt of arterial blood, which was stopped without ligature or even torsion. Beneath the skin in this place I found a thick, tough fascia. I made an incision in this, then pushed through it a tough, grayish or bluish-white substance, very soft, but firm, and not easily broken down.

After making opening in the skin and fascia large enough to introduce my hand, I could with but little trouble separate the contents of tumor from skin, which I did for six or eight inches. Withdrawing my hand, the skin was carefully divided, and in this way I worked my way around to the point of beginning. Then with my hand and the handle of my scalpel I dissected the jelly-like mass from the body, dividing only some muscular bands thrown down, or loops of muscle brought down, for the support of tumor, but the skin seemed to be the principal support, portions of which was over an inch thick, and quite firm.

Expecting retraction of the skin, I left a stump, and after removal of tumor it was a hollow one, about four inches long. We sponged it out with carbolic acid, and closed it up with sutures. It healed generally by first intention, and without an untoward symptom.

We divided the tumor, and found it to be uniform in composition, as above described. On division there oozed from the cut surface a clear fluid, but slightly colored with blood, and not, or but slightly, viscid. The question arises, from whence did it receive its nutrition? Probably through a multitude of small vessels situated in the skin, which retracted immediately on division. The vitality was low, as may be seen from the lack of any effort of the ulcer on its surface to heal. From its almost entire freedom from sensation, we infer that its supply of nerves was very small indeed. Its weight was forty-seven and one-half (47½) pounds. No microscopical examination of the tumor was made.

Oct. 25th.—I visited Mrs. Y. She had just returned from a visit to her father, about seven miles distant. The first three she had ridden on horseback, last four walked, showing but little fatigue. She was much improved in her general appearance and flesh, and had entirely lost her careworn look. Complained only of pain and weakness in back and hips. The wound, save a very small portion over gluteus, was smoothly healed up. The skin over this portion had, as we expected, retracted to about the general surface; but not so in front, leaving at this point quite a tumor, but which we hope will diminish somewhat. It now extends to about seven inches below pubic bone, having the same appearance as before removal, only not so large. The labia are still to be seen, much as before removal of tumor. Over the hips and back the skin has the appearance of that on the belly of a multiparous woman.

Reports of Hospitals.

BELLEVUE HOSPITAL.

NOTES OF PRACTICE AND PECULIARITIES OF TREATMENT.

COMPOUND COMMINUTED FRACTURE OF THE FEMUR IN ITS UPPER PORTION—NON-UNION—PLASTER-OF-PARIS DRESSING—TREATMENT BY BUCK'S EXTENSION.

At the time this man was admitted to the hospital he was suffering severely from shock. The appearance of the limb suggested amputation. The wound was dressed according to Lister's method, Buck's extension apparatus applied (adhesive plaster, weight, and pulley), and on the following morning the condition of the patient was so good that it was determined to make an effort to save the limb. From the 15th of September until the 30th of November, the extension apparatus was worn, the wound was kept clean and dressed with carbolized dressings, and the general condition of the patient continued very favorable. At the end of that time the dressing for the fracture was removed, when it was found that union of the bone was not firm. A plaster-of-Paris splint was then applied, embracing the foot, leg, and the thigh to the perineum. It was applied for the purpose of securing a firm union of the bone. It was said that, if the patient could get up and move about, a condition of affairs would be established which favored perfect union. The patient could roll about in his bed, and expressed himself as feeling much more comfortable than when wearing the extension apparatus. A fenestrum was cut in the splint, so that the wound could be easily exposed to view.

The plaster-of-Paris dressing for fracture of the thigh was not recommended by the visiting surgeon, however, unless experience had been had in its application, and the patient was where he could be closely watched.

A CASE OF DOUBLE PLEURISY—SUCCESSFUL AND UNSUCCESSFUL ASPIRATION.

Double pleurisy is a rare disease. The history of the case was clear, and so well borne out by physical examination of the chest, that it is believed to be worthy of mention. Four months ago a negress, æt. 32, who was in her usual health, was taken with a chill, which was followed by severe "stitching" pain in the left side. The severe pain continued three or four hours, then gradually subsided; but more or less pain was present during the succeeding week. At the end of that time she was seized with pain in the right side, which was of a less severe character than that in the left side. During the week between the development of the pain in the left and in the right sides, the patient suffered very much from irregular chills. The pain in the sides was followed by a cough; she had vomited or spit up blood at irregular intervals, sometimes as large a quantity as a teacupful, and had lost some flesh.

She was worse about two months ago than at the present examination, and now felt worse than she did in the early part of her sickness.

On physical examination, there were found flatness upon percussion, and absence of all respiratory and voice sounds over the lower portion of the chest, exaggerated respiration over the upper portion, and the line of percussion dulness was distinctly changed by changing the position of the patient. The voice was too feeble to render vocal fremitus of very much importance as a physical sign. The apex-beat was in its normal position. There was no general anasarca or other symptoms which would lead one to suspect that she had kidney or cardiac disease, and the conclusion was reached that the patient had fluid in both pleural cavities, and that it was inflammatory and not dropsical. The patient had little or no present evidence of febrile movement.

Since admission to the hospital, both sides of the chest had been aspirated. From the right side three ounces of clear blood were obtained, and from the left nothing. The patient had been aspirated, however, five times before admission, and twice both blood and serum were drawn off. The fact that she had had irregular chills, sometimes followed by fever, was thought to lead to the suspicion that there was something besides malaria giving rise to them, and the question arose whether she did not have acute empyema at the beginning, and also whether there was not pyæmia behind that. To answer the question required a careful study of the history of the case and its subsequent progress.

TREATMENT OF EPIDIDYMITIS.

A case was seen; it was caused by gonorrhœa, and the following suggestions with reference to treatment were noted:

When a case of gonorrhœa presents itself, make the patient wear a suspensory bandage. It might prevent the occurrence of swelled testicle.

If the epididymitis is seen early, and the pain is severe, make needle punctures in the tunica vaginalis and relieve the hydrocele which causes the pain.

As a rule, it was not advisable to use urethral injections during the acute stage of epididymitis.

When the testicle begins to swell, the urethral discharge commonly ceases, and returns when the swelling subsides. Sedative lotions, fomentations, leeches, and cold may be employed during the acute stage. Rest in bed is important, and usually it is sought by the patient. Leeches, if used, should be applied along the course of the spermatic cord. If applied to the scrotum, they may give rise to troublesome extravasations of blood. A ready method of supporting the testicles, and giving them rest and freedom from pain, is by ordering the patient in bed, and by passing a broad strip of adhesive plaster under the scrotum, and from one thigh to the other.

KARL FREDERICH HEINRICH MARX, the senior of the Medical Faculty of Göttingen, is dead. He was, after the celebrated Weber, the oldest member of the Royal Scientific Society, and was a Knight of the Order of Guelph. The deceased was born at Carlsruhe in 1796, and studied at Heidelberg. He became a professor in Göttingen before he was thirty years old, and celebrated several years ago his fifty-year jubilee.

LECTURES ON HYGIENE IN HOLLAND.—Regular professorships of hygiene will shortly be established in the universities of Holland. Dr. Ludwig Hirt, of Breslau, has been unanimously chosen by the Faculty of the University of Utrecht to fill the new chair in that university. It is not yet known whether this choice will be confirmed by the Dutch Government. There is some reason to think that the government would have been better pleased if the choice of the Faculty had fallen on a native Hollander.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, January 5, 1878.

HOW TO MAKE CONTRIBUTIONS TO MEDICAL JOURNALS MOST AVAILABLE.

For many months past we have been struck with the great quantity of really valuable material which has been published in the different medical journals of the country. There is no doubting the fact that the number of medical writers is markedly increasing, and that, as a whole, their communications are more voluminous and frequent than they have ever been before. Gratifying as this may be as an indication of progress and as a promise for the future, we are convinced that much that is of great practical value to the profession at large is buried either in journals which are inaccessible to the mass of medical readers, or in those volumes of Transactions of State Societies whose circulation is limited to the members of those organizations.

The question which concerns the authors of valuable papers, and the profession at large who wish to benefit by such publications, has reference to the best means which can be adopted to insure the greatest good to all. The latter is obviously accomplished by the widest possible circulation which can be given to the author's views. One of the principal obstacles to this is the obligation which is imposed upon practitioners, all over the country, of supporting their local journals. There would certainly be no objection to the encouragement which such periodicals receive if we were always certain that the end justified the means. Too frequently, however, the journals are mere college organs, and outside the circle of school and strictly local interests their very existence is scarcely known. In some localities so much partisanship is displayed by the supporters of rival sheets that it becomes almost a matter of honor to contribute to their columns all the available material which can be gathered in the neighborhood.

It is not our purpose at present to discuss the benefits which the profession, as a whole, derives from these publications, inasmuch as we might lay ourselves open to the charge of hindering what interested parties might call legitimate enterprise. The main difficulties in the way of real usefulness of these organs is their necessarily limited circulation, and it is with this objection that we have to deal in considering the best interests of many talented medical writers. Of course it would be unwise, impolitic, and, under the circumstances, almost unfair to discourage any effort which is made in the direction of conscientious duty. In the face of such convictions on the part of a large majority of these contributors, any advice to pursue a contrary course would be useless. We have therefore to accept the situation and make the most of it.

The only thing which can be done, under the circumstances, is the publication of abstracts of these papers in the leading journals over the country. The larger the circulation of such a journal, the greater the obligation to publish such abstracts. But the difficulties in the way of doing even this are often insurmountable, and render almost nugatory the best directed efforts. The difficulties of obtaining original articles for the smaller local journals are obviously great, and explain the extreme and unnecessary length of the majority of them. A certain number of pages must be filled, and no other choice is left. As a consequence, the conscientious editor of a journal who desires to obtain everything of possible value from his exchanges, is compelled to wade through an incredible amount of reading before he can accomplish his purpose. Oftentimes this labor is so entirely unproductive that he finds it easy to quiet his conscience by preferring the shorter articles. Although the latter are always more extensively read, it by no means proves that longer articles are not of real value, and should not have equal attention. For the purposes of quotation, however, it is found practically that such attention is so much oftener the exception than the rule, that in the interests of all we are tempted to make a suggestion to the effect that the author of every elaborate article, either in a journal or in the Transactions of his society, should succinctly state at the end of such article the conclusions at which he has arrived. If these are carefully made, the benefits of his observations can be given to the readers of other journals at once, leaving all who may be specially interested to study the line of argument in detail from the original sources. It is impossible to estimate how much good the general adoption of such a plan would accomplish. We speak from a long experience in medical journalism when we say that the secret of prompt and wide-spread quotation rests more upon the terseness of conclusions than the skilful elaboration of the arguments upon which they may be founded.

For purposes of general reading, also, these lengthy journal articles could by such means be more exten-

sively useful. The circumstances which surround every practitioner compel him to economize his time as much as possible. In most instances, if he must read a long article from beginning to end to obtain what may be useful to him, he defers it to the more convenient season, which never comes; whereas if he can get the conclusions at once he is satisfied, and is ready to apply them to the treatment of cases he may have on hand.

In this connection we take the opportunity of saying, *en passant*, that the most taking and widely-quoted articles are those which bear upon points of the treatment of disease. The reasons for this are quite obvious, when we consider that the mass of the readers of medical journals are practitioners who are anxious to learn of every new method, and apply it with the least possible delay. How to cure disease is with them the vital question, and the more effectually medical writers strive to answer it, the better will their labors in the cause of scientific progress be appreciated.

Following out the principle embodied in this article, we would simply state that, in view of the great amount of valuable material scattered throughout the medical journals and the Transactions of medical societies, which may otherwise run to waste, the best means of benefiting authors and readers by a wider dissemination of views in the shape of abstracts in other journals, is the publication of the conclusion at the end of said articles. As this advice applies with equal force to our own contributors, we have had a double purpose in offering it.

MEDICAL AND SURGICAL HISTORY OF THE WAR.

THE annual report of the Surgeon-General of the United States Army, although but a brief pamphlet of eighteen pages, is too decidedly suggestive to be passed with a mere memorandum of contents, particularly as the histories of surgical cases rendered accessible to the general practitioner by the publications of the department form a valuable adjunct to surgical education in this country. A pertinent illustration of this point is furnished by the statement on page 13, that at the end of the fiscal year June 30, 1876, histories of 227,098 surgical cases, and of 40,502 operations had been tabulated. At the same date 4,093 cases had been collected for a report of the surgical cases treated in the army since the publication of circular No. 8, August 17, 1871. To these data the past year has added record of 1,559 cases, making a grand total of 5,652. Of these, injuries to the head and neck include 2,062; injuries to the trunk, 455, and injuries to the extremities, 1,554—the whole involving 311 amputations and 24 excisions. The remaining 1,581 are classified as miscellaneous.

What mainly interests the profession, in view of this rapid accumulation of the classified facts of surgical experience, is the arrangements for continuing the publication of the Medical and Surgical History of the War, of which copies have already become somewhat rare and difficult to obtain. The work of stereotyping the medical volume of Part II. of the Medical History of the War was commenced in January last, under the able supervision of Dr. J. J. Woodward; and up to July 30 about 350 pages had been stereotyped. The volume will be ready for issue probably before the expiration of the present fiscal year—that is, previous to June 30, 1878. The projected second edition of 5,000 copies of the second volume of Part II. of the Medical and Surgical History of the War has been completed under the supervision of Assistant-Surgeon G. A. Otis, and the third volume is now in progress, so that the profession in this country may presently anticipate a fuller supply of those invaluable contributions to the literature of surgery.

As the contributions to medical, surgical, and sanitary science developed by the experience of the war belong to the whole country, and form an essential part of our medical and surgical history, it is perhaps to be regretted that larger editions were not printed in the first instance; for although a fresh demand for stereotyped work can be supplied at any time, delays will necessarily occur in matters depending upon appropriations, and intervals of scarcity can only be provided against by very liberal editions. The current work of the department is valuable, of course, but it cannot enter into competition for value with the vaster experience accumulated by one of the most gigantic wars that the nineteenth century has recorded, the data of which have long since been carefully classified, and should have been made accessible to the general practitioner. Condensations and hand-books have their function for easy and convenient reference, but it is to the official publication that the profession must turn for complete and unedited information; and the Surgeon-General and his coadjutors cannot be too highly complimented for the efficiency with which they are pushing their part of the work.

ALBANY ETHICS, AND HOW TO SUPPRESS QUACKERY.

THE profession has always been interested in the suppression of quackery. It may be a matter of congratulation with some to learn that many of the most prominent medical gentlemen, here and elsewhere, are fighting the quacks with their own weapons and hoisting them with their own petards. The time appears to have arrived when it is necessary to inform the public that there is considerable learning and skill in the regular profession, but which, in consequence of a false and culpable modesty, has never before been brought to notice. Of course, it must be admitted that in allowing our personal horns to be blown, or, what is perhaps more to the purpose, blowing them ourselves, there is a slight risk of being classed with the very quacks which we wish to condemn; but any such action

as would be hazardous to lesser men, is, however, entirely safe, dignified, and justifiable with men of reputation. Under the circumstances, then, it is well that these matters are so entirely in the hands of our seniors, and that there are no chances of the public mistaking the sheep for the goats. There is always something touching and unselfish in the pains which are taken by medical men to set the people right on matters connected with the treatment of diseases. Heretofore, however, professional jealousy has more or less interfered with the development of a true Samaritan spirit, but all barriers are now being broken down for the good cause, and medical gentlemen of the first standing are willing to certify where the most skilled services can be secured.

To Albany has been reserved the proud distinction of taking the initiative in this matter, by establishing a principle that wherever true merit exists among their number, medical men gladly acknowledge it publicly and privately. There is, it is true, somewhat of a mutual admiration society about the affair, but in the present advanced state of public opinion regarding our relations to each other, and the necessity of avoiding professional quarrels, this is of secondary importance to the grand end in view. It would appear that there has been a crying necessity for a well-equipped eye infirmary in that enterprising medical centre, and as that idea evidently originated with a prominent oculist of that place, he very properly asks the indorsement of some of his medical friends. Although the gentlemen cheerfully certify to his skill, and are very willing to have "any use" made of their names, they evidently did not dream of such certificates being published. In fact, this was so contrary to all established usage, that it was beyond their contemplation. But the unexpectedly complimentary character of some of these letters compelled "the gentleman in question" to waive considerations of personal delicacy, sacrifice himself to the higher interests of the institution, and submit copies of these complimentary letters to the board of managers, who publish them in pamphlet form. It is of course unnecessary to say that these reports, calling for pecuniary subscriptions to the institutions, are intended only for medical men. As we are informed that the high opinions of the surgeon's skill, fitness for his position, etc., are from "prominent physicians," nothing more is needed to secure the success of the institution. As the best of reasons are given for "waiving all personal delicacy" on both sides, we have no doubt that all parties are pleased, and that each and every one will work harder than ever in behalf of suffering humanity. For further particulars apply to the office of the Surgeon-in-chief, which is also "the principal office of the body corporate and where all communications should be addressed." Let us in conclusion congratulate our Albany brethren that they can rise so far above ordinary prejudices and unite with such unanimity in dealing such a fatal blow against quackery. One thing more remains to be done, and that is to advertise the infirmary by the year in the daily papers of that city, and with all the certificates attached.

HOSPITAL STEWARDS AND THEIR PAY.

A MOVEMENT understood to have the approval of the Surgeon-General, or at least not opposed by him, has been set on foot with a view to the reorganization of an important department of the medical service of the United States, and will be pressed earnestly upon the attention of Congress this winter. The petition, with a view to raise the standard, rank, and pay of the stewards in the medical department of the army, proposes a division into three classes, with the designation of Medical Stewards, members of the first class to have the rank of Regimental Sergeant-Major, but junior on all occasions of ceremony or command save within the department itself; the second, the rank of Sergeant of the Medical Department, and to be promoted to first class after service of two years; the third, designated as Probationary Stewards, to consist of men selected from the enlisted men of the army, or specially enlisted from civil life. The latter, after a probation of one year to discover their general or special aptitude and competence for the service, may be promoted to second class, but, preliminary to enlistment, must pass an examination in pharmacy, minor surgery, bandaging, dressing, etc., as well as in reading, writing, arithmetic, and general attainments. The stewards petition for a pay of $50 per month, with an increase of $5 per month for each five years of continuous service to stewards of the first class, and the same rations, fuel, quarters, and clothing allowance as are now rendered to hospital stewards. The pay of the second class is rated at $30 per month, and that of the third at thirty cents a day, in addition to their regimental rank and allowances. It is proposed, furthermore, that any steward of the first class who shall have served faithfully for thirty years, shall be entitled to a pension equal to three-fourths of his pay, if incapacitated by wounds, injuries, or disease, provided such incapacity is not in consequence of immoral conduct. The remainder of the document specifies certain necessary but rather immaterial details as to uniform, modes of appointment, and the like, which are of no interest to the non-military reader.

It is stated by those cognizant of the facts that the medical officers of our army enjoy a rank, pay, and consideration superior to those attendant upon the medical service in the great armies of Europe—a position won after many battles and very considerable snubbing. Several attempts have been made correspondingly to improve the standing of hospital stewards, though hitherto without any substantial result. The present attempt embodies the sentiments of the most moderate and thoughtful of the stewards now in

the service, and is heartily indorsed by medical officers, post-surgeons, and directors of military departments, as essential to the efficiency of the service, and to secure really competent men for the positions to be filled? The petition is thus officially representative of the medical as well as of the pharmacal arm of the service, and hence in a form to receive such attention from Congress as no mere petition of stewards in their private capacity could properly command; and as the medical officers who have affixed their signatures are the most competent judges of the necessity for a reorganization, no special inquiry is necessary to intelligent action or earnest advocacy. It may be objected that while the army is on a peace footing, it is not just the time to set about reorganizing such a department, or to talk about increasing the pay of army officers and followers. The increase, however, is very trifling—only sufficient, indeed, to assure a reasonable competition, and hence to secure competent persons for such posts; and as the health and efficiency of the army depend very materially upon the capacity of the medical stewards, the proposal is one that should be acted upon at once, irrespective of the other considerations. Indeed, there is no time like an interval of peace for securing an efficient organization of details that would necessarily be overlooked in attending to major matters, were an untoward event to precipitate a conflict with Mexico—a contingency liable to occur at any moment. Besides, although the duties of a medical steward are arduous and responsible, the pay is ridiculously small, and should be increased as a matter of simple justice.

Reviews and Notices of Books.

CYCLOPÆDIA OF THE PRACTICE OF MEDICINE. Edited by DR. H. VON ZIEMSSEN. Vol. XV. Diseases of the Kidney. By Prof. CARL BARTELS, of Kiel, and Prof. WILHELM EBSTEIN, of Goettingen. Translated by REGINALD SOUTHEY, M.D., Oxon., of London, and ROBERT BERTOLET, M.D., of Philadelphia. ALBERT H. BUCK, M.D., New York, Editor of American edition. William Wood & Co. 1877.

No organ of the body has recived more careful attention from students of medicine than the kidney. Not satisfied with the immense advances that were made by Bright, observers the world over have continued carrying out the most minute and painstaking investigations, both as to the microscopic characters of the different forms of disease and their clinical history. It is fair to say that in the latter particular and in etiology progress has not been so decided as in the matter of pathological anatomy. Even now we find the most diverse ideas ruling as to the relations which the various stages of the so-called Bright's disease hold to one another, though the nature of the minute changes is pretty clear. Nor have we reached definite ideas as to what uræmia is, and the clinical importance of albuminuria and dropsy. Still we are making progress, even if it amounts to little more than showing the inadequacy of old theories. Bartels informs us that from his personal investigations on the blood in marked instances of uræmia he has sometimes found the amount minimal, in one case but 0.01 per cent., so that an excess of urea in the blood could not in that case have been held to cause the symptoms, nor does he think that Frerichs's theory of ammonæmia (the carbonate of ammonia in the blood) can explain all cases, for he has failed to find it present in undoubted uræmia. The third hypothesis of Traube, that two conditions are essential, viz., watery blood and increased blood-pressure, fails in cholera, when uræmic symptoms supervene. The real cause he does not venture to assert with any positiveness, simply regarding the symptoms as "caused by some disorder of the urinary secretion," due sometimes to a disproportion between the production and the elimination of urea. There is a manifest effort to clear up our knowledge of dropsy and albuminuria, which Bright thought were always due to pathological changes taking place in the kidney, and yet we know now, on the one hand, that advanced kidney disease may take place without either, and on the other, that both phenomena may be associated with a normal or but little damaged kidney. Albuminuria, indeed, owes its existence simply to increased blood-pressure, and dropsy to protracted diminution in the secretive pressure. Both conditions are most often met with in diseased kidneys, but they do not either necessarily depend upon a deterioration of the tissue of the organ.

Dropsy, indeed, may be one of the very first symptoms of a kidney affection. The classification which the author has adopted for what has been known as Bright's disease seems to be a move in the right direction, though one which is opposed to German ideas, while more in accordance with results that have been reached in this country.

According to Bartels the common Bright's kidney does not run through three stages, one of hyperæmic swelling, a second of infiltration, and a third of contraction, but all of these conditions may be independent one of the other in their causation. All such affections, including the waxy kidney, he would group under the common name of diffuse diseases. His divisions would be: first, *active* hyperæmia, such as is produced by the application of cantharidal preparations; and *passive*, where there is an obstruction to the circulation, as plugging of the renal veins. Then we have ischæmia of the kidney (the choleraic affection); then acute parenchymatous nephritis, very commonly found in scarlatina, and having the title of acute diffuse nephritis, acute desquamative nephritis (Johnson), hemorrhagic nephritis (Traube), the catarrhal and croupous nephritis of the Germans, albuminous nephritis (Rayer). Next comes chronic parenchymatous nephritis; the second stage of Bright's, the non-desquamative nephritis of Johnson, and the néphrite parenchymateuse profonde of Lecorché, or the "large white kidney." This rarely follows the acute parenchymatous nephritis, and is not the precursor of the contracted kidney. Its origin is insidious. He knows of no case in which the nephritis of diphtheria became chronic, but he does know that it may happen in scarlet fever. The acute form developed by exposure and cold may become chronic, but he believes that long-continued exposure to cold and moisture may bring on the chronic affection without any previous acute attack. The acute parenchymatous nephritis of pregnancy is an affection that may, according to statistics, occur in one out of 186 cases: the chronic affection is more apt to follow than in the other forms of acute nephritis.

Renal cirrhosis, a synonym for renal sclerosis, granu-

lar atrophy of the kidney, contracted kidney, interstitial induration or inflammation, the third stage of Bright's disease, is believed to be due to a pathological process of its own, independent of the diffuse inflammations already described. But this condition is not one of old age, as held by Gull and Sutton, but rather, according to his statistics of thirty-three cases, one that occurs between the ages of thirty and forty. It is four times as frequent in men as in women, and belongs to every class of society.

The process, according to Gull and Sutton, commences about the small vessels, and is described as arterio-capillary fibrosis, and is thought to be merely a symptom of wide-spread disease of the entire arterial system. The exact nature of the renal change is regarded as uncertain.

Waxy degeneration is not an affection of the vessels in the kidney merely, but of the entire system. It is in some way connected with suppurative processes, but almost wholly when the pus becomes exposed to the air; for large purulent collections may be confined and never give rise to the change. This degeneration, strange as it may seem, occurs only in the arteries of the digestive tract, the spleen, the liver, the kidneys, the supra-renal capsules, the lymphatic glands, and the thyroid body. We observe that he says nothing about parenchymatous degeneration of the kidney, a condition which not long ago was thought to describe the kidney in phthisis, phosphorus poisoning, and typhus, but prefers rather to use the word inflammation. It will probably be some time before we shall have these matters cleared up, though we are sorry to lose sight so thoroughly of the word diffuse in the classification given us.

Those who have done much recent work in the histology of the kidney will appreciate the fact that the great majority of kidney troubles are of a strictly diffuse character—that is, it is not merely the epithelial elements that are involved, but the framework of the organ.

Ebstein closes with affections of the pelvis and ureters, perinephritic tissues, renal tumors, parasites, and anomalies, with diseases of renal vessels. Taken as a whole, the book is a most extended treatise on the recent literature of the subject, and gives the present attitude of the questions on renal matters now before us. New material in the way of illustrative cases has been added in abundance.

THE QUESTION OF REST FOR WOMEN DURING MENSTRUATION. The Boylston Prize Essay of Harvard University for 1876. By MARY PUTNAM-JACOBI, M.D., Prof. of Mat. Med. in the Woman's Medical College, New York. New York: G. P. Putnam's Sons. 1877.

THE question which Dr. Putnam-Jacobi has set herself to study in this essay is one which has of late years attracted much attention, both on the part of the medical profession and the general public; and to the former especially, the views of one who, besides her special qualifications for studying this subject, has already won for herself in other fields the name of a ripe student and a conscientious observer, will prove exceedingly interesting. The essay is divided into six sections. In the first the author makes a good point of the fact that the women of the lower classes have in no age or country been absorbed in domestic occupations and the education of children. The trades corporations of the middle ages, in some places at least, included women. In the United States the census of 1870 showed that one-sixth of the entire female population was taking part in the paid industry of the country. Section two is devoted to statistics derived from 268 answers received to a series of questions that were sent to about a thousand women. The tables compiled from these answers are so numerous and complicated that we are afraid the average man will be tempted to skip them bodily. Unfortunately, despite the care and study expended on them, the statistics are of but little value; they are too few in number, and moreover nothing is said about the class or classes of women to whom the circulars were sent.

The third section, which deals with the theory of menstruation, is to our mind the best in the book. The views of all the prominent writers on the subject are alluded to, or described at length, and the arguments in favor of the two theories most generally accepted at the present day are compared and analyzed with consummate skill. The author herself accepts the theory that ovulation and menstruation are distinct and not necessarily coincident processes. She holds that the menstrual flux is the result of degenerative changes in the uterine mucous membrane which has become hypertrophied as a preparation for pregnancy, combined with a plethoric condition of the general system, which was also a preparation for pregnancy. It is the simple climax of a series of consecutive processes perfectly continuous with one another, which began at the termination of the preceding menstruation.

In the next section the author gives the result of a series of investigations of the excretion of urea, the temperature and the pulse, in a small number of women during, before, and after menstruation. These investigations proved that the arterial tension begins to rise after menstruation, and reaches its acme at the next premenstrual period, to fall again during the flow. In all the details evidences were found of a gradual and steady preparation for the menstrual hemorrhage; hence, the idea that normal menstruation can have any tendency to deplete the nutrition or lower the strength, must be discarded. An exhaustive argument is made to prove that the premenstrual plethora is provided for by diversion from the voluntary muscular system, which accounts for the weakness of the muscular system of woman as compared with that of man.

The whole aim of the author is to prove that in normal cases menstruation is a perfectly painless process, and that the loss of blood is provided for beforehand in such a way that it can exert no evil influence on the nutrition of the body. Hence, it follows that neither mental nor bodily rest is necessary during the flux. In cases of painful menstruation, it is true, rest is absolutely necessary; but then there is question of a diseased, and no longer of a perfectly normal process. While, however, denying that woman demands rest during menstruation, the author admits that the female sex is lacking in muscular strength and power of fixed attention, the natural consequence of which is an inability to work as long or as intensely as the male sex. This inherent weakness renders rest necessary for women, but to be effectual the rest must be "at short intervals and lasting for a short time, and not at long intervals and lasting longer."

In conclusion, we will only add that the manner in which the entire subject is treated is most masterly, and that every page in the book gives evidence of great erudition. The greatest fault that we have to find with the essay is that the style in which it is written is too abstruse. It is often difficult to follow the argument, which makes reading it a task, whereas it should be only a pleasure. We welcome it, however, as a most valuable contribution to the literature of menstruation.

Reports of Societies.

NEW YORK PATHOLOGICAL SOCIETY.

Stated Meeting, November 28, 1877.

DR. E. G. JANEWAY, PRESIDENT, IN THE CHAIR.

LOCALIZED COLITIS—TRAUMATIC IN ORIGIN—DEATH FROM PERITONITIS.

DR. LOUIS H. SAYRE presented a specimen of intestinal invagination removed from a young gentleman, aged nineteen years, to whom he was called on the previous Tuesday afternoon. The only symptom complained of was a slight pain in the epigastrium. The pulse was 100, and there was no elevation of temperature. He was, however, intensely restless, and continued in that condition two days, when peritonitis suddenly showed itself, from which he quickly sank and died.

On post-mortem examination the abdominal walls were covered with a recent exudation of lymph. There was some slight amount of serum in the peritoneal cavity. At the junction of the transverse and ascending portions of the colon there was a hardened mass, caused by the accumulation of fæces, and the intestinal wall containing it was attached to the lower lobe of the liver evidently by old adhesions. The recent peritonitis had its focus in this point. On inquiring more particularly into the primary cause of this localized inflammation, it was ascertained that three years previously the patient had been struck in the side, that symptoms of inflammation had followed, and that since that time he had suffered more or less from constipation. It appeared that the fatal peritonitis was the third one from which he suffered since the injury. The intestine was invaginated and completely plugged.

DR. L. A. SAYRE remarked that he had seen the case with his son, and had been struck with the extreme restlessness of the patient and the anxious expression of the countenance. Another remarkable point was the absence of any symptoms of peritonitis until a few hours before death. He was of the opinion that the invagination commenced subsequent to the first inflammation following the injury.

DR. JANEWAY called attention to a sacculation in the gut, but no rupture was discoverable.

IN CASES OF SPONTANEOUS GANGRENE SHALL AMPUTATION BE PERFORMED?

DR. SANDS presented a set of specimens illustrating the changes in the arteries in a case of spontaneous gangrene. He first saw the patient, a gentleman aged 49 years, in consultation with Dr. H. T. Hanks, August 15, 1877. He learned that there was a history of repeated attacks of rheumatism, the earliest occurring in the twentieth year, and some of them being attended with cardiac symptoms. During April of this year it was further stated that the patient while in bed became suddenly and completely unconscious, and remained so for a period of three hours. It did not appear certain from the history whether this attack was due to faintness or to cerebral disease, but it was conjectured by Dr. Hanks that the cause of the trouble was an embolus plugging up some of the cerebral vessels. Dr. Hanks saw him August 7th, when he had been suffering for six weeks with pain in the lower extremities, they being most marked in the calves of the leg and most intense in the left limb. August 6th, while absent in the country, the patient noticed a violet discoloration on the fourth toe of the left foot. Becoming alarmed, he repaired to the city and consulted Dr. Hanks, who at once appreciated the fact that the discoloration was an indication of impending gangrene. At that time both lower extremities were carefully examined by Dr. Hanks, who found them exceedingly cold and painful, and with very feeble circulation. No pulsation could be detected in any arteries below the femoral on either side at the apex of Scarpa's space. Four days after the beginning of the gangrene in the left foot a similar spot appeared in a similar place on the right foot. On the 15th, when Dr. S. saw the case, several toes of the left foot and two of the right foot were discolored. The heart had been carefully examined by Dr. H., and found to beat very feebly and with marked irregularity. No murmurs were detected, although they were supposed to exist and to be masked by the feeble action of the heart. When Dr. Sands returned in October from a visit into the country, he was somewhat surprised to learn that the patient still survived. The gangrene had then progressed until it involved the feet on both sides up to the line of the tarso-metatarsal joint. The question of amputation was considered but not advised. A short time previous to his death the patient showed evidences of pneumonia of the right lung.

The autopsy was made by Dr. Satterthwaite, who furnished the following account:

Post-mortem examination.—Body extremely pale in color. Emaciation marked. Rigor mortis of usual degree.

Thoracic cavity.—Heart abnormally large, and externally well supplied with fat. Apex in axillary line; transverse diameter increased; left ventricle considerably hypertrophied; both ventricles dilated; aortic orifice calcified and narrowed; mitral also calcified, and so narrow that the little finger could not pass through it (button-hole aperture). Both ventricles and auricles distended with blood. Pericardial sac contained about three ounces of serous fluid, somewhat darker than usual, but transparent. *Right lung* normal, except for hypostatic congestion in posterior and inferior portions. Post portion of upper lobe adherent to walls of chest by moderately firm adhesions. *Left lung.*—Upper and anterior portion of upper lobe firm and non-aërated. On section, appeared to be the seat of hemorrhagic infarctions of various dates (with surrounding pneumonia). Hypostatic congestion of posterior part of lower lobe, on the inferior surface of which are some shreds of recent lymph. *Pleural cavities* contain an excess of fluid. *Kidneys.*—Right cortex thickened and adherent, and surface in places granular; numerous markings of old and more recent cicatrices. In some can be seen yellow colorations, as if of blood-pigment; in one or two appeared to be a plugging of the vessel (indicative, presumably, of infarctions). Left, in about the same condition. *Splsen.*—Small, contracted, and contains one or more calcific deposits, and showed several cicatrices. *Liver.*—Right lobe appeared fatty; left, thin and marked by a slight unevenness of surface, as if cirrhosis were commencing. Stomach, pancreas, and intestines and genito-urinary apparatus not examined. *Aorta.*—Abdominal aorta marked by atheromatous (fatty, not calcareous) patches throughout its whole extent. Just above the bifurcation an atheromatous ulcer of an irregularly oval shape; the right common iliac thickened by calcific deposits, and ulcerated at points. Occlusion of the left femoral was noticed just below the point where the profunda was given off. From this point downwards the vessel was filled with a firm plug. The

plugging in the right femoral occurred somewhere in the lower part of the vessel before it became the popliteal. Microscopically, it was found that the right lobe of the liver was fatty and pigmented. In the kidney the chief change was in the tubes, where the epithelium was in many places replaced by granular matter.

DR. SANDS thought that the specimen was interesting as showing how very extensive the plugging of the arteries is likely to be when the gangrene is limited in extent, a fact which enables us to adhere to the rule commonly laid down, not to amputate in such cases. He had seen three other cases of spontaneous gangrene, in all of which the question of amputation had arisen, and in which it had been decided in the negative. He had never met with a case of spontaneous gangrene in which either of the arteries of the leg were pervious. He suspected that gangrene did not commence until the obstruction above was considerable in amount and extent. The question had been raised in the case presented that evening, whether the morbid process was one of embolism or thrombosis. It might have been both. It seemed, however, more likely that the process was one of arteritis primarily. He did not know of any case in his own experience of progressing senile gangrene in which amputation had proved successful. He was, however, aware that amputation had been successfully performed high up on the thigh by James, of Exeter, but that was altogether an exceptional case.

DR. J. C. PETERS had seen a case somewhat analogous to the one related by Dr. Sands. The patient was a gentleman seventy-five years of age, who suffered from frequent attacks of gout with cardiac paroxysms. Following one of these attacks there was arterial obstruction in the right leg. The patient died comatose before gangrene was fairly developed. The valves were perfectly sound, and the aorta was remarkably free from atheroma, still there did not seem to be a doubt that there had been a plugging of both the arteries of the brain and of the leg from emboli. No thorough post-mortem was allowed.

DR. WEIR referred to a successful amputation for gangrene performed by Lister's method.

DR. JANEWAY referred to a case of gangrene of both feet occurring in a woman aged thirty years. Her circulation appeared to be good, and there did not seem to be any cause for the trouble. At the autopsy a small thrombus was discovered just above the heart valves, in the aorta, not more than half an inch in length and a quarter of an inch wide. Portions of this were broken off, and caused an obstruction in the lower part of the femoral on both sides. There was a spot of ulceration at the seat of the thrombosis in the aorta.

DR. SANDS referred to a case of gangrene of the leg for which amputation was performed by Dr. Gouley at the knee-joint, and through presumably healthy tissue. The principal feature of the operation was, that no arteries bled; even the popliteal was plugged. Gangrene subsequently appeared in the stump, and the patient died.

DR. SAYRE stated that he had operated upon a case the exact counterpart of Dr. Gouley's, except that the patient recovered. The amputation was by Stephen Smith's method, at the knee-joint.

CARDEN'S AMPUTATION—RELIABILITY OF CATGUT LIGATURE—SECONDARY HEMORRHAGE.

DR. BRIDDON presented a specimen of caries necrotica opening into the knee-joint, and read the following history, for which he was indebted to Francis Huber, House Surgeon to the Colored Home:

W. E. L., æt. 21; S.; waiter; brown skin; admitted March 27, 1877. Family history excellent.

With exception of whooping-cough, patient is not aware of having had any of the other diseases of childhood. Had pleurisy on left side about eight years ago; tertian intermittent fever two years ago; gonorrhœa a year ago. About three years ago he had buboes (the one on right side suppurating.) There is no history of any sore on penis, nor evidence of secondary syphilis. The patient is temperate and regular in his habits, and as a general thing has enjoyed fair health. About a year ago he sprained his left knee. Soon the joint began to swell, and he limped a little in walking. In the morning the knee would be stiff, but upon exercising this would disappear. The swelling in the joint has continued in spite of treatment.

On admission, patient is well nourished; complains of swelling and stiffness of left knee. Upon examination, chronic synovitis is diagnosed.

The appetite is fair; the bowels are constipated; tongue is clean. P., 72; R., 21; T., 99°. Urine amber, acid; 1020; no albumen.

October 15, 1877.—As the patient did not improve under treatment followed, the limb was put up (about six weeks ago) in plaster-of-Paris. A fenestra having been made over the anterior aspect of knee, the exposed surface was anointed with oleate of mercury (five per cent.) every other day. The patient complaining of pain in the part, the dressing was removed, and, upon examination, indistinct fluctuation could be discovered in tissue about the joint, no acute symptoms having been perceived.

October 20th.—As pointing was taking place at one spot, an exploring syringe was introduced, and bloody pus withdrawn. The abscess was then laid open, and a careful digital examination by Dr. Briddon failed to discover any direct communication between the joint and the peri-articular abscess. Very little fluid could now be detected in the joint.

November 3d.—Tissues about the joint are very much swollen; considerable lateral motion is found. Pain excessive on moving the limb. The patient has lost some flesh; his condition is not as good as it was three months ago. Diagnosis, fungous arthritis.

November 7th.—Re-examined to-day by Drs. Briddon and Mason. Find that the patient can bend the knee to some extent; can twist the leg, and bear his weight upon the affected extremity. Very little pain is experienced in the posterior portion of knee, or when the articular surfaces are approximated. Greatest pain is felt in external lateral ligaments. Temperature since the abscess has been opened is more or less elevated. Though no direct communication can be detected between the joint and the abscess, yet when the parts are pressed upon a fluid resembling synovia, tinged with blood, can be made to exude.

November 8th.—Physical examination shows feeble respiratory murmur on both sides (more marked on left side). Voice not especially exalted; moist râles at apex of right lung posteriorly; left lung expanding less perfectly than the right. No change on percussion.

Heart.—A distinct aortic systolic murmur (somewhat harsh in character) is heard on auscultating the heart.

November 10th.—To-day the patient was etherized, and, after further consultation with Drs. Mason and Sabine, Dr. Briddon proceeded to amputate the limb. The operation was done antiseptically, the details insisted upon by Mr. Lister being followed to the letter. The limb was removed above the condyles of the femur,

Carden's operation, with a short posterior flap, being performed. Three arteries only had to be ligated. As a portion of the pyogenic membrane of the peri-articular abscess was adherent to the anterior flap, it was removed by scraping with a Simon spoon, and a sinus passing upwards was treated in the same manner. A drainage tube was put in, and the flaps were then approximated by numerous antiseptic sutures. All this time the spray had been playing upon the limb. The protective antiseptic gauze, etc., were then applied, and the stump bandaged first with antiseptic gauze (three inches wide), then with a common muslin roller.

When the joint was opened a considerable amount of grumous material escaped. On inspection, the joint was found completely disorganized, the fibrous structure swollen and succulent, the synovial membrane in an advanced condition of pulpy degeneration, inter-articular fibro-cartilages almost completely destroyed; cartilages of incrustration absorbed; on the external border of the external condyle a small carious cavity, and another cavity in the head of the tibia containing a sequestrum.

November 11th.—The patient rallied well after the operation, and in four or five hours felt very comfortable. This morning about five o'clock slight oozing of blood occurred. Soon stopped, but recurred again in about half an hour. In the absence of Dr. Briddon, the dressing was removed by Dr. Huber, the house surgeon, the spray playing on the limb all the time. As the blood then began to flow from both ends of the drainage-tube in a stream, a Petit's tourniquet was applied, and the hemorrhage controlled. The sutures were then removed (the lips of the wound being in a fair condition to unite), the clots turned out, and then it was discovered that the bleeding came from the popliteal artery. This was ligated with catgut ligature of same quality as that which had been applied before, the wound washed, a drainage-tube put in, and the edges of the flaps approximated by carbolized silk sutures. Everything was done antiseptically, as on the previous day. The patient rallied well after the second operation, and in a few hours was in a very contented frame of mind.

November 12th.—Patient appears to be in excellent condition. Eats well and rests well. Temperature not elevated to any extent.

November 13th.—Dressing removed, and a new one applied. No sloughing of flaps. Slight grumous discharge from drainage-tube.

November 15th.—Drainage-tube removed, and a new dressing applied. Patient doing well.

November 17th.—Every other silk suture removed; gaping of edges to some extent; very little union by first intention. Slight bagging in posterior flap. Discharge grumous and somewhat offensive. New dressing applied.

November 19th.—Dressing removed and remaining sutures taken out; gaping to such extent then occurred that adhesive plaster had to be applied. A pocket of some size existed in the posterior flap, filled with grumous pus. Suppuration very free.

Antiseptic dressing discontinued, and dry substituted. Dr. Briddon expressed the opinion that he did not consider it proper that the accident that changed the character of the operation-wound should be charged to the method, but rather to its defective application, the insecure manner in which the ligature was applied to the main artery; the reliable character of the material used was proved subsequently by the fact that gut of the same size, and prepared at the same date, was used to secure the vessel from which the recurrent hemorrhage occurred; that although the stump was opened with all precautions under the spray, the manipulations had interfered with the process of union so as to invite suppuration; that at this time, nine days after the operation, suppuration was so free that disinfection could have only been accomplished by a free application of chloride of zinc; that such interference with a stump that had been the seat of recurrent hemorrhage would be apt to disturb the thrombus in the main artery, and he considered it safest to resort to ordinary dressing.

November 21st.—To-day a clot was washed out from between the edges of the wound. Grumous pus is still discharged in considerable quantities.

November 28th.—Since last note the dry dressing has been renewed daily, the wound being washed out with sol. acid. carbolic. (℥ to Oj.) Union by granulation has taken place over about nearly the whole extent. Remaining portion looks very well. Suppurative process slight; pus laudable. Patient's general condition excellent. The stump is admirably formed and bears considerable pressure.

Dr. Mason remarked that Dr. Briddon's was the third case in which he had seen secondary hemorrhage following the use of a catgut ligature, and for that reason he was a little suspicious of its safety. Dr. Sayre concurred in the latter view.

Dr. Weir stated that Mr. Bryant's experience was to the effect that the catgut ligature was safe, and all things considered, was the best at our disposal. Mr. B. was of the opinion that the middle and internal coats were divided at the time of the operation. Dr. W. was in the habit of using a third knot for extra safety.

Dr. Briddon said that the ordinary square knot would not untie by being soaked in a fluid, even for a considerable period.

Dr. Sands had used catgut ligatures in three sections in securing the pedicle in ovariotomy, and with success.

Dr. Mason thought that although the catgut ligatures might be applied with safety in the continuity of an artery, they were liable to slip from the end of the vessels in the case of stumps. Generally speaking, these ligatures were not strong enough to allow of being tied tightly.

Dr. Weir remarked that Lister was in the habit of soaking the ligatures in the serum of bullock's blood for twenty-four hours, and then testing them for strength.

Dr. W. T. Bull also reported a case of secondary hemorrhage following the use of the catgut ligature. The patient sustained a severe comminution of the leg as the result of a street-car accident. Amputation was performed through the condyles of the femur. The antiseptic method was employed, but there was sloughing of one flap, and that condition continued in spite of treatment until the eighth day, when a profuse secondary hemorrhage occurred while the patient was asleep. The orderly in charge, instead of stopping the bleeding by pressure, ran for the doctor, and when the latter arrived a clot had formed and the hemorrhage had ceased. The patient did not rally, and died in the course of a couple of hours afterwards. The artery, on examination, was found discolored and sloughy for a distance of a quarter of an inch on the cardiac side of the point of ligature.

DOUBLE FRACTURE OF FEMUR, AND DIFFICULTY IN DIAGNOSIS.

Dr. Bull also presented a remarkable double frac-

ture of the femur, one fracture comminuted in character and occurring in the centre of the shaft, the other a vertical fracture through the cervix femoris. The patient, a female, died of septicæmia on the sixth day. The fracture at the neck of the femur was not suspected; in fact, the question occurred how, under the circumstances of an additional fracture in the shaft, such a lesion could be diagnosticated.

TYPHOID FEVER WITHOUT DIARRHŒA.

DR. JANEWAY presented specimens removed from two cases of typhoid fever, the points of interest of which centred in the absence of diarrhœa.

DR. ROBINSON referred to a case in point in which, because there was no diarrhœa, other physicians could not believe it to be one of typhoid fever.

The Society then went into Executive Session.

Correspondence.

QUININE AND CINCHONIDIA.

TO THE EDITOR OF THE MEDICAL RECORD.

DEAR SIR:—On the 15th of December the retail price of quinia sulphate was $3.30 to $3.50 per oz., avoirdupois, and that of cinchonidia sulphate 70c. to 80c. About the same time it was stated by one of the prominent manufacturers of cinchona alkaloids that, "from April to September, inclusive, our sales of sulphate of cinchonidia were double those of sulphate of quinia."

Those who have given even a small amount of attention to the medical journals of the past year, have not failed to observe the number of communications from physicians all over the country, speaking in most favorable terms of the merits of cinchonidia sulphate as compared with the more expensive alkaloid. Many of these letters have been republished and again circulated in the interests of manufacturers and dealers, and it is not unreasonable to presume that this has been the principal cause of the increased demand for cinchonidia sulphate.

In view, however, of the considerable difference in price and the alleged similarity in therapeutical effects of the two salts, one is naturally led to conjecture that this increase may also depend somewhat upon a disposition to substitute the cheap for the expensive salt when the latter is prescribed.

I have no doubt that cinchonidia sulphate will answer most purposes fulfilled by quinia sulphate in a majority of cases, but I can hardly believe that the demand for it, on the part of physicians, has increased within a year or two in a way to correspond with the statement above quoted.

Another point to which I wish to call attention in this connection, and which comes within the range of my own experience, is that in some cases where I have prescribed cinchonidia sulphate, patients have reported that they paid nearly the same price as when quinia sulphate had been ordered.

F. A. C.

URINARY EXAMINATIONS.—Dr. William S. Ely, of Rochester, has devised a very convenient blank for recording urinary examinations.

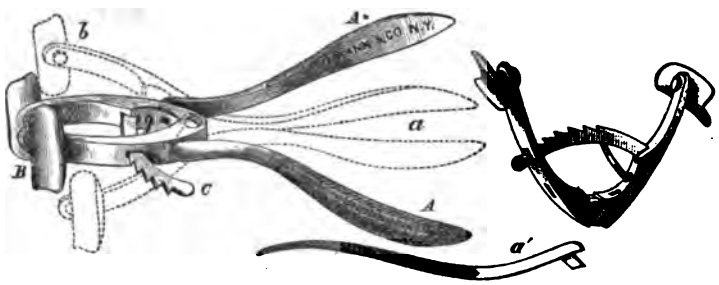
New Instrument.

A NEW MOUTH-GAG.

BY ROBERT F. WEIR, M.D.,

SURGEON TO THE NEW YORK AND ROOSEVELT HOSPITALS.

THE present instrument is intended to more satisfactorily accomplish an end than has hitherto been done by the various mouth-gags now in use. The one devised by T. Smith, of London, and modified by Whitehead, is cumbersome, and the tongue-depressor attached to it is liable to cause interference with the breathing during the state of anæsthesia. Francis Mason's gag, otherwise excellent (*British Medical Journal*, January 22, 1876), has such awkwardly long handles attached to it that they are in the way of the operator and his assistants. The gag which has been of the most service in the operations performed on the mouth at the Roosevelt Hospital, has been that known as Hutchinson's (of London). It is depicted on page 606, Holmes' "Treatise on Surgery" (American edition), and commends itself by the small space it occupies in the mouth. It is, however, somewhat difficult to introduce, unless the jaws are first considerably separated; and also, by reason of its expansion being limited by the elasticity of the flat steel springs which enter into its construction, it is frequently dislodged by the voluntary or involuntary efforts of the patient. The first objection is, however, the most important, and to meet this as well as the last, the changes depicted in the accompanying woodcut have been made.



Instead of trusting to the action of a spring, the hinge has been substituted, with movable handles (*A*, *a'*) thus permitting the jaws of the gag to be entirely closed (*B*) and facilitating its introduction between the teeth. It also allows, by the leverage of the handles, the fullest distention of the mouth. After this has been satisfactorily accomplished, the little ratchet holds the jaws firmly apart. This ratchet is easily unloosened; in the diagram, however, it is placed too far from the hinge. After its introduction, as in Hutchinson's instrument, it is turned to one or the other side of the mouth, out of the surgeon's way, on the pivots by which the tooth-cups (duly lined with lead or rubber) are attached.

It has now been tested a number of times, and has been found to answer its purpose very efficiently.

ST. LOUIS MEDICAL AND SURGICAL JOURNAL.—Drs. William S. Edgar and D. V. Dean have retired from the editorship of this journal; the former on account of failing health, and the latter in consequence of press of other business. They are to be succeeded by Drs. Thos. F. Rumbold and Hiram Christopher.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from December 28 to December 29, 1877.

SMART, CHAS., Capt. and Asst. Surgeon. Granted leave of absence for one month. S. O. 260, A. G. O., Dec. 21, 1877.

KING, J. H. T., Capt. and Asst. Surgeon. Granted leave of absence for one month, on surgeon's certificate of disability. S. O. 214, Dept. of Texas, Dec. 19, 1877.

HAVARD, V., 1st Lieut. and Asst. Surgeon. Assigned to duty at Fort A. Lincoln, D. T. S. O. 177, Dept. of Dakota, Dec. 20, 1877.

DAVIS, WM. B., 1st Lieut. and Asst. Surgeon. Assigned to duty at Fort Totten, D. T. S. O. 177, C. S., Dept. of Dakota.

Medical Items and News.

CONTAGIOUS DISEASES.—Comparative statement of cases of Contagious Disease reported to the Sanitary Bureau, Health Department, for the two weeks ending December 29, 1877.

Week Ending	Typhus Fever.	Typhoid Fever.	Scarlet Fever.	Cerebro-Spinal Meningitis.	Measles.	Diphtheria.	Small-pox.
Dec. 22.....	0	21	63	4	56	71	0
" 29.....	0	18	90	2	50	82	0

DR. JUAN B. PONCE DE LEON departed this life on Friday, the 4th ult., succumbing to an exhausting attack of an acute cerebral disease. He was born in Matanzas, Cuba, and completed his scholastic course of studies at the University of Havana. At the age of eighteen he came to New York City and matriculated at the College of Physicians and Surgeons, from which he was graduated in 1860.

Then and ever since all who knew him recognized in him a dutiful student of the sciences, and an earnest devotee to medicine. His professional studies were extended to Europe, and from Paris he brought away testimonials from a number of the eminent leaders of the French school. He served as surgeon both in the hospital and on the field in our civil war, and since its close has practised general medicine in this city, in Westchester, and in Mount Vernon, N. Y. He was a member of the Westchester County Medical Society.

In the profession he was esteemed and respected, in his social relations beloved, and he will ever be remembered by his numerous friends as a conscientious and good physician, and an honorable and generous man.

DIALYZED IRON AS AN ANTIDOTE FOR ARSENIC.—Dr. Thomas B. Reed reports (*Phila. Med. Times*, Dec. 8, 1877) a case of poisoning by arsenic cured by the administration of dialyzed iron (Wyeth's). The dose was half a table-spoonful well diluted in water, repeated at first every ten minutes, and then every half-hour, until several doses had been administered. The first dose relieved all the burning pain and other suffering.

DEATH FROM INHALATION OF ETHER.—We regret to have to record a case in which the administration of ether terminated fatally, and which occurred in the practice of Dr. G. M. Lowe, of Lincoln. The patient was a lady forty-eight years of age, who had discharged the duties of a governess in the family of Dr. Lowe, and had for some time past been suffering from cancer of the breast. A consultation was held, and the removal of the tumor determined upon. The administration of the ether was confided to Dr. Mitchinson, who had large experience in its employment. All proper precautions appear to have been taken. Dr. Mitchinson examined the heart, and, finding it rather feeble, directed the patient to take a little brandy and water. She was quite cheerful, though somewhat nervous. Half an ounce of ether was poured on the inhaler, which was placed over the mouth in the usual way. The valves were open, and gave free ingress and egress to the air. After a few inhalations the patient's face suddenly became turgid and the hands white. The inhaler was at once removed, the tongue brought forward, cold water dashed over the face, and the chest rubbed with brandy; but the breathing became stertorous, the face more and more congested, the pulse failed, there was an effort at vomiting, and death took place within a few seconds. A post-mortem was made by Mr. T. Sympson, the Senior Surgeon of the Lincoln County Hospital, assisted by Mr. T. Brook. On examining the heart, they found that it was feeble and flabby, and some of the tissue, being afterwards examined, was found to have undergone fatty degeneration. The liver was firm, but the whole of its upper surface was attached by old adhesions to the under surface of the diaphragm—the muscular partition between the chest and the abdomen. There was a little effusion of serum on the brain. The air-cells of the lungs were dilated. The valves of the heart were in a perfectly healthy condition. They also carefully examined the throat, and found nothing there to throw light on the cause of death. The stomach was perfectly healthy; the deceased had not partaken of any food for some time before the ether was administered, which is a point of great importance. Mr. Sympson attributed the fatal result to failure of the heart's action, and the impairment of the functions of the diaphragm in consequence of its attachment to the liver. The fibres of the heart were so feeble as to be unable to bear any extra strain, and the efforts at resuscitation proved abortive owing to the failure of the functions of the diaphragm. Mr. Brook's evidence was to the same effect. They noted, in addition, that the right side of the heart was gorged with blood, that the walls of the right ventricle were very thin, and that there were some nodules of cancer in the liver and lungs.—*Lancet*, Nov. 17.

HOW TO INTRODUCE THE HYPODERMIC NEEDLE.—Dr. S. J. Allen, of White River Junction, Vt., writes: Placing the palm of the left hand beneath the patient's arm or leg, with the thumb and fingers draw the skin tight over the upper aspects of the limb, in which state you have an unyielding integument. Then holding the instrument with the thumb and index finger of the right hand, place the bevelled side of the point upon the place you have selected, at a proper angle with the surface; then, with a quick forward movement of the thumb and index finger only, keeping the hand immovable, thrust the point through the skin into the subcutaneous tissue. This manœuvre, if done

quickly, will inflict little if any pain, and the patient will thank you, especially if he has been previously subjected to the almost universal method of pinching up a fold of integument for the puncture.

DR. CHARLES H. BURNETT, the author of a treatise on diseases of the ear, and to whom reference was made in the recent article of Dr. Sexton, is a resident of Philadelphia instead of Washington, D. C.

TURBULENT STUDENTS IN PARIS.—The medical faculty of the University of Paris has been much exercised of late over some innovations that have been instituted by the Minister of Public Instruction. A protest was drawn up and signed by all of the professors, with the exception of one, Mr. Chauffard, who declined to sign it. This exhibition of independence apparently outraged the delicate sensibilities of the medical students, and they determined to read the recalcitrant professor a lesson. A body of them accordingly attended his lecture, and drowned his voice by cat-calls, snatches of popular melodies, and other devices for silencing unpopular speakers, that are familiar to unregenerate medical embryos. The professor endured these annoyances for about five minutes, and then quietly left the room. This was a victory scored for the students, but they were not left long in the enjoyment of it. A few days later a notice was posted up, to the effect that hereafter only certain classes of students will be admitted to the lectures of Prof. Chauffard, and they only on the presentation of their matriculation tickets.

COST OF THE GERMAN UNIVERSITIES.—The twenty universities of Northern Germany cost the country annually about two millions of dollars. The University of Leipsic alone receives $250,000. These twenty universities have a staff of 1,250 professors, who receive salaries varying from $500 to $8,000. The young man who embraces the career of teaching can calculate on having a salary of $2,000 when he reaches the age of thirty-five. He is certain also of a pension when retired. Germany has a university for every two millions of inhabitants, Austria one for five millions, England one for seven millions, and Switzerland one for one million.

POPULATION OF FRANCE.—According to the census of 1876, the increase in the population of France in the four preceding years was 802,867, or 2.17 per 100; in 1872 the population numbered 36,102,921, and in 1876, 36,905,788. Nearly one-third of the increase was due to immigration, chiefly from the lost provinces of Alsace and Lorraine. The average annual excess of births over deaths in the whole of France was only 138,000. This is a strikingly small increase for a country as populous as France, and it has aroused serious apprehensions in the breasts of Frenchmen for the future of their country. In twenty departments there was an actual diminution of population; according to the report the principal causes of this were a decrease in the number of marriages, an excess of deaths over births, changes in the agricultural methods, and emigration of country people to the towns. The documents do not give figures from which the relative influence of these different causes could be deduced, but it is probable that the last mentioned was the most active in the production of the effect. Nearly two-fifths of the general increase of the population was in towns of more than 30,000 inhabitants. This movement of rural populations towards the cities is not a new one, nor is it peculiar to France; but, when considered in connection with the relatively small number of births, it has a more vital and alarming significance in that country than in any other country in Europe.

PROSTITUTION IN FRANCE is encouraged there by certain economists, on the ground that over-population is prevented, and that the country is thereby made richer. Conception is proved to be very rare among regular prostitutes, and when it does occur, miscarriage is almost the invariable rule. This lowers the birth rate, it is true; but how about the source of all wealth —human labor. A tailor who habitually sold his garments "below their actual cost," was asked how he made money by the operation. "Because I sell so many of them." This is probably the way France will become enriched by the adoption of its new doctrine.

ST. LUKE'S HOSPITAL.—Drs. George Wheelock and W. M. Polk have been appointed as attending physicians, *vice* Drs. Leaming and Packard, resigned by reason of expiration of service; and Dr. G. H. Wynkoop as surgeon, *vice* Dr. J. L. Little, whose term of service has also expired.

CRANIA OF THE BOTANS OF FORMOSA.—Dr. Stuart Eldridge recently read some very interesting notes on the above subject before the Asiatic Society of Yokohama, Japan. The paper, which is now published, is accompanied by some very interesting photographic illustrations.

HORSEFLESH.—During the first six months of 1877 the butchers who deal in this commodity in Paris have delivered to consumption 5,283 horses, donkeys, and mules, which furnished 959,730 kilos of meat (net). During the corresponding period of 1876 the number of these animals was 4,422, which gave 803,500 kilos. The increase is, therefore, of a marked character. The persons who endeavored to popularize the use of horseflesh affirm that it is more wholesome and more nourishing than beef, although often not quite so agreeable. Paris contains more than fifty butchers' shops specially devoted to this article. A very good pot-au-feu may be made with the inferior morsels at the price of 25 centimes and 30 centimes the pound. The choicest pieces—fillet, undercut, etc.—are much higher in their cost.—*Veterinary Journal*, London.

ACTION OF HEMLOCK SEEDS ON MICE.—After verifying the fact that belladonna is not poisonous to rabbits, M. Hoekel undertook some very interesting experiments to ascertain the effects of the different solaneæ on rodents and marsupials. Among other experiments he took two mice and fed them entirely on hemlock seeds for eight days. They did not take kindly to the new diet, and even seemed to suffer some from it at first. At the end of the eighth day one of them was very sick, but the other remained healthy. On the next day the experimenter found only the relics of the sick mouse; the survivor had evidently tired of the vegetable diet, and made a meal of his feeble companion. During the eight days that the experiment continued, the animals devoured doses of hemlock that would have been fatal to a man.

A CASE OF TRIPLETS.—Mme. Saffroy, a midwife of Étampes, reports this case: She was called a short time ago to attend a woman in labor at full term. A male child was born at 11 A.M.; a second child, of the female sex, at 12 M.; and a third child, also a girl, at 12.30. The two first children presented the head, the last the breech. There were three separate placentas. Delivery was easy, but was followed by hemorrhage. The children were viable and well formed, and weighed about 6½ pounds apiece. Eight years before the mother was delivered of twins, who are still living.

WM. WOOD & CO., Publishers, 27 Great Jones Street, New York.

☞ SUPERIOR TO THE PEPSIN OF THE HOG.

INGLUVIN

FROM THE

Ventriculus Callosus Gallinaceus.

A specific for VOMITING IN PREGNANCY, a potent and reliable remedy for the cure of INDIGESTION, DYSPEPSIA, and SICK STOMACH, caused from debility of that organ. It is superior to the Pepsin Preparations, since it acts with more certainty, and effects cures where they fail.

"A New Remedy, INGLUVIN."

By A. F. SHELLY, M.D., of Philadelphia.

"This is obtained from the gizzard of the domestic fowl (chicken), and is a ***Specific for Vomiting in Pregnancy.*** I have used this remedy for twenty-five years, and it has never failed. It is also the most ***powerful*** and ***reliable remedy*** for the ***Cure*** of ***Indigestion, Dyspepsia,*** and ***Sick Stomach,*** caused from debility of that organ. It is useful in all cases where pepsines and pancreatines are used, but with much more certainty of good results.

"In complicated affections of the Stomach, such as ***Inflammation, Gastralgia, Pyrosis,*** etc., it may be combined with Subnitrate of Bismuth and opiates; and in Diarrhœa and Cholera Infantum, with astringents, both vegetable and mineral. I have given the article to several prominent physicians, who have used it with the happiest results, among whom I may mention Prof. E. WALLACE, of the Jefferson Medical College."

AN EFFICIENT REMEDY AND AN AGREEABLE SUBSTITUTE FOR COD LIVER OIL.

PROF. TROUSSEAU'S

CARBONIZED

FRESH MEAT CURE

Consisting of TENDER, RAW, LEAN BEEF, desiccated in vacuum, combined with CARBON as an antiseptic, and medicated with HYPOPHOSPHITES OF LIME, SODA, and POTASSA with CINCHONA. A medicated, nourishing food, pleasant to take and easily digested, for the cure of

Consumption, Chronic Dysentery, and Exhausted Conditions consequent upon Typhus and Typhoid Fevers, Typhoid Pneumonia, Diphtheria, General Debility, Nervousness, and Prostration from whatever cause.

In presenting this to the Medical Practitioners of the United States, we scarcely deem it necessary to extol a remedy the efficacy of which they must determine by actual trial. We believe, as Pharmaceutical Chemists, that we have overcome a difficulty by making this preparation of fresh meat stable under all circumstances; while, at the same time, it is potent, efficacious, and palatable.

ALWAYS SPECIFY "K. & M." GRANULATED EFFERVESCENT SALTS.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen.—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KEEN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

K. & M.

Granulated Effervescent Preparations

Of Magnesium Citrate, Potassium Biearb., Citrate, Benzoate, and Bromide. Lithium Benzoate and Carbonate; Cerium Nitrate and Oxalate; Bismuth Citrate (SOLUBLE), Pepsin, and Bismuth; Pepsin, Bismuth, and Iron, etc., etc., etc.; also the following

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case $9 00
Quarts, 2 dozen in a case 7 00

In Saratoga. *Delivered at the Cars.*

Pints, 4 dozen in a case $8 00
Quarts, 2 dozen in a case 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York**, will receive prompt attention.

McKESSON & ROBBINS'

Gelatine-Coated Pills and Granules.

We take occasion to thank the profession and trade for their patronage of our **GELATINE-COATED PILLS**, and request a continuance of the same. Full lines of our Pills have been established in all the large centres of trade, and in many of the smaller cities. To those living in remote places we will be happy to mail any formulas on our list, not procurable nearer home, upon receipt of price.

We regret to announce that our attention has been called to several instances where other pills have been substituted by druggists when ours were desired, and even specified, by the physician. We believe that such instances are rare, but in some cases physicians have notified us of such breach of honor in the druggist.

☞ **New additions to List. Send for full Price List of our Pills.**

McKESSON & ROBBINS' PILLS ARE SPHEROIDAL OR CAPSULE SHAPE. Specify McK. & R.

CHARCOAL (Willow) 5 grs.....60 per 100

The value of pure powdered Willow Charcoal in Dyspepsia, Indigestion, and all affections arising from derangements of the stomach, such as Headache, Heartburn, etc., is well known. Its use must necessarily be much increased, since it is, for the first time, presented in a convenient, reliable, and unobjectionable form in our Gelatine-coated Pills.

EXTRACT CANNABIS INDICA, ¼ gr. $1.25 per 100.

This important extract is manufactured in our own laboratory, and the pills, when cut, exhibit in a marked manner, the distinctive color, taste, and odor of the freshly-made extract. We copy from the U. S. Dispensatory the following: "In morbid states of the system it (*Ext. Cannab. Indic.*) has been found to cause sleep, to allay spasms, to compose nervous inquietude, and to relieve pains: it differs from opium in not diminishing the appetite, checking the secretions, or constipating the bowels." "The complaints in which it has been specially recommended are neuralgia, gout, rheumatism, tetanus, hydrophobia, epidemic cholera, convulsions, chorea, hysteria, mental depression, delirium tremens, insanity, and uterine hemorrhage."

For doses, see U. S. Dispensatory.

SALICIN, 2½ and 5 grs.....$2.50 and $4.50 per 100.

Salicin is becoming more and more favorably known in the treatment of rheumatic affections; also as a tonic and antiperiodic, and is best exhibited in our Gelatine coated Pills.

In acute rheumatism, Salicin has been found very efficacious, and, according to *The Lancet*, "not less certain than Quinine, for ague." It has also been claimed, in large doses, to be an absolute specific in ulcerative choroiditis.

COCA EXTRACT, 1 gr. (McKesson & Robbins') $2.00 per 100.

The extract used in these pills is manufactured in our laboratory from fresh leaves. Coca is a South American plant, used by the natives as a substitute for tea, coffee, tobacco, hashish, and opium of other countries. It imparts vigor to the muscles as well as to the intellect, and enables the partaker to endure great fatigue with ease. The feeling of exhilaration accompanying its use is said not to be followed by any depressing effects.

Dose, 1 to 4.

JABORANDI EXTRACT, 3 grs..$3.00 per 100. (Made of McKesson and Robbins' Extract.)

These pills present a much better form of administering this powerful diaphoretic and sialagogue than any of the liquid preparations. Valuable in rheumatism and syphilitic troubles of long standing. Dose, 1 to 3.

SANDAL-WOOD EXTRACT, 1 and 2 grs. $2.00 and $3.00 per 100.

These pills contain both the oil and resin existing in sandal-wood, are believed to be superior to the oil alone, and are more convenient of administration. The extract is manufactured from the wood, in our laboratory.

SALICYLIC ACID with SULPHATE MORPHIA,.....$1.25 and $2.00 per 100.

Two sizes containing 2½ and 5 grains Salicylic Acid, united with 1-12 and ¼ grain Sul. Morphia respectively. Strongly recommended in Rheumatism, both acute and chronic.

QUINIDIA SULPH., 1, 2 and 3 grs., .80, $1.50, and $2.20 per 100.

CERIUM, OXALATE, 1 gr.. .... 1.00 per 100.

ALOIN, 1 gr..... .. .... 1.50 per 100.

SULPHIDE CALCIUM, 1-10 gr... 75 per 100.

CITRATE CAFFEIA, 1 gr..... 4.00 per 100.

FERROCYANIDE IRON, 3 grs.. 60 per 100.

DIALYSED IRON (Merck's scales) 2 grs. $1.25 per 100.

VALERIANATE of AMMONIUM, 1 gr. $1.00 per 100.

MONOBROMATED CAMPHOR, 2 and 3 grs. $1.50 and $2. per 100.

It is now being considerably used in treatment of Spermatorrhœa; strongly recommended in cases of Cerebral-Anæmia; used successfully in Infantile Convulsions from teething; Hysteria, Headache from over study or nervousness, and Nymphomania. Dose, 3 to 4 grains.

ERGOTIN PILLS, 3 grs... .....$2.00 per 100.

We manufacture our Ergotin with great care from the best quality of fresh selected Ergot, and it contains in the most potent form all the active constituents of Ergot of Rye, each grain representing 10 grains of Ergot, and each pill being equal to half a teaspoonful of official fluid extract. The value of Ergotin in the place of the crude drug and the fluid preparations is conceded; and it is being largely administered both in this country and in Europe. It has taken a prominent place in the treatment of neurotic diseases. Many of our most reliable practitioners, and particularly those of extended experience in gynecology, assert that they have never found a preparation of Ergot, in which, by experience, they felt as much confidence as in McKesson & Robbins' Ergotin Pills. The advantages of prescribing it in this form will be readily acknowledged. Dose, 1 to 3.

We offer our Ergotin, prepared specially for hypodermic use in one ounce bottles, $1.50 per oz.

PHOSPHORUS, 1-100, 1-50, 1-20, 1-12 gr. $1.00 per 100.

The pure transparent Gelatine we use is in no degree porous, it preserves the Phosphorus perfectly in the free state. We have the Phosphorus in state of solution in the excipient we employ, this insures a gradual elimination of the Phosphorus in the stomach, thus avoiding the severe irritation that is so often experienced after taking the ordinary Phosphorus Pills, which are prepared by mixing the Phosphorus in substance with the excipient, in which small fragments of Phosphorus often remain. Note remarks by Dr. Squibb, in his paper before Am. Pharm. Ass'n, Sept., '76, in which he states that Phosphorus should never be administered in substance, and if a coating be used, he commends Gelatine.

Many of the most eminent Physicians throughout the country, among whom are leading specialists in the treatment of Neurotic diseases, assert that McKesson & Robbins' Phosphorus Pills are the most rational medium yet found for exhibiting Phosphorus.

PHOSPHORUS COMPOUND, 1-50, 1-60, and 1-100 gr. ... .$1.25 per 100.

PHOSPHORUS COMPOUND AND IRON, $1.25 per 100.

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists, 91 Fulton St., New York.

NOTE. In reply to inquiries in regard to CHANGE IN COLOR of our QUININE PILLS, we beg to state that the change is due to our using PURE WHITE SULPHATE OF QUININE, instead of UNBLEACHED of the Guaranteed standard of 90% Sulphate of Quinine, as formerly, (the custom having been to employ 111 ounces of Unbleached Quinine, in place of 100 ounces of White Quinine.) This change to White has been made to avoid misrepresentation. The mass of our Pills has also been greatly improved, in appearance and solubility, by the use of our new excipient. Respectfully,

McKESSON & ROBBINS.

See Advertisement of McKESSON & ROBBINS' GRANULES, Gelatine-Coated, see Page 32.

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist.

Explanatory Circular mailed on application.

(P. O. Box 4,517), 2 and 4 Platt Street, New York

LOEFLUND'S EXTRACT OF MALT

Is recommended to physicians for its **purity** and **superiority** over all others. It is perfectly free from **Alcohol, Carbonic Acid and Empyreumatic Products**, which can only be attained by the **most careful manipulations** in its manufacture, **long experience**, and by means of **unexcelled apparatus**. Mr. Ed. Loefund, of Stuttgart, Germany, manufactures only Malt preparations, devotes his whole time to these; and being a thorough Chemist, makes a preparation based upon **scientific principles**. For this reason his Preparations were awarded a **prize** at the **Centennial Exhibition**. **Loefund's Concentrated Extract of Malt** is a **Resolvent Emollient** and most powerful **Nutritient**. It is used for diseases of the **respiratory organs, pulmonary complaints**, and for diseases originating in **imperfect digestion**. **Price per bottle, 75 cents.**

Loefund's Extract of Malt with **Pyrophosphate Iron.**
" " " **Citrate Iron and Quinine.**
" " " **Iodide Iron.**

Loefund's Extract of Malt with **Hypophosphite Lime.**
" " " **Pepsin.**
" " " **Hops.**

Each of these **$1.00 per bottle.**

Loefund's Concentrated Leibig's Food for Infants (Leibig's Soup for infants in a concentrated form), **ready for use**, has been pronounced by the Judges of the Centennial Exhibition: **A perfect Substitute for Mother's Milk**, and therefore awarded a prize. Price, 75 cents per bottle.

Circulars giving full particulars will be mailed to all parts upon application.

CAUTION TO THE TRADE AND PUBLIC.—The labels on Loefund's Preparations should be carefully examined. The signature of ED. LOEFLUND appears on the right lower corner of the genuine label; in the centre, the *Trade-Mark*; and on the *left lower corner*, the words: Sole Agent for America, ALBERT C. DUNG, Druggist, 61 Bowery, New York.

The genuineness of these only is guaranteed. All labels are printed in the *English Language*.

Loefund's Extract of Malt Lozenges contain a large proportion of **Extract of Malt**, and are **very efficacious**, as well as highly agreeable **Cough Lozenges**. Price 25 cents per package.

All the above preparations are kept by the leading druggists. Orders by mail promptly filled by

ALBERT C. DUNG, 61 Bowery, New York.

Especially adapted and recommended for administering concentrated or nauseous medicines; free from taste or smell. Preventing irritation of mouth or throat, and injury to the teeth.

Our Capsules are not patented nor **FILLED** with any **SECRET PREPARATION**, but made strictly in accordance with officinal formulas, and contain **NONE** but authorized medicines of the U. S. Dispensatory; are entirely reliable and soluble, free from all **TASTE** or **SMELL**; remain perfect in any climate.

N.B.—Particular attention given to Capsuling **SPECIAL FORMULAS.**

DETAILED PRICE LISTS AND SAMPLES SENT ON APPLICATION.

Sole Agents in America for Blair's Gout and Rheumatic Pills.

Importers of Superior Norway Cod Liver Oil—put up in Pint Bottles; also by Barrel or Gallon, at the lowest market rates.

VACCINE VIRUS.

In order to meet properly the continued demand upon us for **Animal Virus**, we have established stables for its propagation upon carefully-selected heifers. The lymph used is of the well-known "Beaugency" stock, imported by ourselves expressly for this purpose. The result of several years' experience in supplying this lymph leads us to believe that its excellence is unsurpassed. The establishment is under the care of a competent physician, who will spare no pains to produce a perfectly **reliable** and **pure** article, which we are prepared to furnish **fresh, daily.**

We can also furnish, to those who prefer it, **Humanized Virus**, from healthy children, procured for us by physicians of undoubted reliability.

All our Virus is put up in strong, *air-tight, sealed packages*, for safe conveyance by mail or express, and will be sent (postpaid if by mail) upon the following terms:—

From the Heifer, 10 large Ivory Points, well charged on both sides	$1.50
5 large Ivory Points, " "	.80
Large Ivory Points, less than 5, " " each	.25
1 Crust, new method, in air-tight Glass Capsule	2.00
From Healthy Infants, 10 small Ivory Points	1.50
1 Crust from Unruptured Vesicles	2.00

Directions for vaccinating with either form of Virus, derived from methods successfully employed, will be furnished with Virus if requested.

We will warrant every package of Points and every Crust, giving a fresh supply in case of failure reported within fifteen days for Points, thirty days for Human, and ninety days for Kine Crusts. We can usually furnish Crusts one remove from the heifer if preferred.

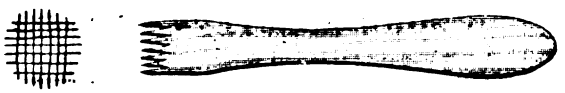
On account of their unreliability, we have hitherto furnished the usual form of Kine Crust unwillingly. Under our new method of taking and preserving them, however, after careful tests and an experience extending over several months, the results obtained have been so satisfactory that we now offer them as not less active and reliable than other forms of Virus, while less liable to become inert with lapse of time. We now offer them on very favorable terms, and recommend them for transmission to a distance, and in all cases where it is desired to preserve Virus for some weeks or months, or to keep a supply at hand for emergencies.

We also furnish **Uncharged Ivory Points**, for physicians' use, at the following rates:—

Small	per 100, 25 cents; per 1,000, $2.00
Large	per 100, 50 cents; per 1,000, 4.00

Orders by mail or telegraph answered by return train.

Liberal discounts upon large supplies for Cities, Towns, and Institutions.



Scarifying Vaccinator, Steel Nickel-Plated. See Cut. Each 25 Cents.

For Samples, address **C. AM ENDE, Hoboken, N. J.**

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take and never causing irritation. Its physiological action secures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of **CASWELL, HAZARD & CO., New York,** and of all respectable Chemists throughout the world.

See List of Wm. Wood & Co.'s Announcements of New Books in Press and Preparing for Publication, page 24.

PURE COD-LIVER OIL.

Manufactured on the Sea-Shore by HAZARD & CASWELL, from Fresh and Selected Livers.

The universal demand for Cod-Liver Oil that can be depended upon as strictly pure and scientifically prepared having been long felt by the Medical Profession, we were induced to undertake its manufacture at the Fishing-Stations, where the fish are brought to land every few hours, and the Livers, consequently, are in great perfection.

This Oil is manufactured by us on the sea-shore, with the greatest care, from fresh healthy Livers of the Cod only, without the aid of any chemicals, by the simplest possible process and lowest temperature by which the Oil can be separated from the cells of the Livers. It is nearly devoid of color, odor, and flavor—having a bland, fish-like, and, to most persons, not unpleasant taste. It is so sweet and pure that it can be retained by the stomach when other kinds fail, and patients soon become fond of it.

The secret of making good Cod-Liver Oil lies in the proper application of the proper degree of heat—too much or too little will seriously injure the quality. Great attention to cleanliness is absolutely necessary to produce sweet Cod-Liver Oil. The rancid Oil found in the market is the make of manufacturers who are careless about these matters.

Prof. PARKER, of New York, says: "I have tried almost every other manufacturer's Oil, and give yours the decided preference."

Prof. HAYS, State Assayer of Massachusetts, after a full analysis of it, says: "It is the best for foreign or domestic use."

After years of experimenting, the Medical Profession of Europe and America, who have studied the effects of different Cod-Liver Oils have unanimously decided the light straw-colored Cod-Liver Oil to be far superior to any of the brown Oils.

COD-LIVER OIL, with IODINE, PHOSPHORUS, and BROMINE.—This combination represents Phosphorus, Bromine, Iodine, and Cod-Liver Oil in a state of permanent combination, containing in each pint: Iodine, eight grains; Bromine, one grain; Phosphorus, one grain; Cod-Liver Oil, one pint.

COD-LIVER OIL, with PHOSPHATE OF LIME.—This is an agreeable emulsion, holding three grains Phosphate of Lime in each tablespoonful.

COD-LIVER OIL, with LACTO-PHOSPHATE OF LIME.

IODO-FERRATED COD-LIVER OIL.—This combination holds sixteen grains Iodide of Iron to the ounce of our pure Cod-Liver Oil.

JUNIPER TAR SOAP.—Highly recommended by the celebrated ERASMUS WILSON, and has been found very serviceable in chronic eczema and diseases of the skin generally. It is invaluable for chapped hands and roughness of the skin caused by change of temperature. It is manufactured by ourselves from the purest materials, and is extensively and successfully prescribed by the most eminent physicians.

FLUID EXTRACT COCA.

NERVINE, STIMULANT. USED IN PERU and BOLIVA as a MASTICATORY.

This Extract contains the entire properties of the leaf of the **Erythroxylon Coca.**

COCA WINE.

This Wine has been successfully used in France as a **tonic**, and found very desirable where a more mild effect of the Coca than the Fluid Extract was desired.

SOLUTION FERROUS CHLORIDE.

This Solution of Iron is the lowest form of Chloride. It is much less Styptic in taste than Tr. Iron Chloride, consequently pleasanter to the patient; is much more easily assimilated by weak and irritable stomachs.

Knowing how difficult it is to introduce into the blood, in a proper form, a sufficient quantity of iron to be beneficial; we have manufactured and introduce the **Ferrous Chloride** as being easily absorbed and acting with much efficacy, even when given in small doses.

RELIABLE ANIMAL VACCINE.

The undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*
This Animal Vaccine can be obtained at CASWELL, HAZARD & Co's., Broadway, cor. 24th Street.

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops,** viz.: Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,
Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT, With Hops (Plain),			**$1 00**
"	"	**Pyrophosphate of Iron (Ferrated),**	**1 00**

NEAVE'S FOOD

FOR

INFANTS

AND

INVALIDS,

Is pre-eminently rich in albumenoids and phosphates, and the starch which it contains is in a state readily assimilated by the infantile digestion.

NEAVE'S FOOD has received the high and unqualified approval of eminent medical men for many years past. It usually commands a ready sale, both in Great Britain and in the States, for it is strongly recommended by mothers to the notice of their lady friends; and infants often give it a preference, refusing other foods. As a natural result, the sale has extended rapidly, especially during the past four years, necessitating the erection of extensive premises, again enlarged in December, 1876, where the preparation is carried on under the personal supervision of Mr. Neave.

NEAVE'S FOOD is sent in large quantities to the Colonies and to the United States. It is prepared with special reference to exportation.

NEAVE'S FOOD is sold in tins and sinfoil packets by chemists and storekeepers at home and abroad.

For terms, apply to any wholesale or export house, or to manufacturers,

JOSIAH R. NEAVE & CO., Fordingbridge, England.

☞ **Doctors and Medical Practitioners wishing to try Neave's Food are requested to apply for a Sample Packet (gratis) at the undermentioned Agency.**

Western Electric Manufacturing Co.

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,

GALVANIC BATTERIES,

BATH APPARATUS, &c.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8½ x 7½ x 4½. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

WESTERN ELECTRIC MANUFACTURING CO.

20 New Church St., NEW YORK. 220 to 232 Kinzie St., CHICAGO.

THE NEW MODEL PHYSICIAN'S MICROSCOPE,

Manufactured by the BAUSCH & LOMB OPTICAL CO.,

Under the direct supervision of MR. GUNDLACH.

While elegant in design, it is low and compact, a great advantage for medical and histological purposes The Stage is large and firm, resting on two strong brass arms. The mirror has a very wide range of motion for oblique light, and may be brought above the Stage for the illumination of opaque objects There is a Sub-Stage, with Diaphragms, which may be placed close to the object or at some distance below it, as the microscopist may wish. Draw tube for increasing power.

The Coarse Adjustment is by rack and pinion, of the best workmanship, and the Fine Movement is by Mr. Gundlach's new device, which has given universal satisfaction.

The Optical Part is of the best quality, and has been specially designed for histological and medical purposes. There are two Eye-pieces, A and C; two Objectives, 3-4 and 1-5, giving eight magnifying powers, ranging from 50 to 375 diameters—sufficient for all ordinary work. There is also a Camera Lucida for drawing, and an eye-piece micrometer with scale and rules for accurate measurement.

PRICE, in Neat Black Walnut Case, with Drawer for Accessories, Lock, Key and Handle, $60.00.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine. Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 8½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

LAZELL, MARSH & GARDINER'S, POWDERED MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts*.

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz.		per oz.
Powd. Ext. Aconite Leaf....	.40	Powd. Ext. Jalap.....	.40
Powd. Ext. Aloes.....	.40	Powd. Ext. Lobelia.....	.40

FOUGERA'S COMPOUND IODINIZED COD LIVER OIL

Since the introduction of this oil in 1858 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine,** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each. DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

L. REICH,

DIRECT IMPORTER OF THE CHOICEST AND PUREST

HUNGARIAN WINES

EVER BROUGHT TO THIS COUNTRY.

STRICTLY FOR MEDICINAL USE.

Respectfully informs the members of the Medical Profession that he has opened an office at

13 West 11th St., New York.

Those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES,** which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:

NEW YORK, *April* 10, 1877.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. Reich and his Wines to our professional brethren.

J. MARION SIMS, M.D.,
Late Surgeon to the Woman's Hospital, New York.

ALFRED L. LOOMIS, M.D.,
Prof. of Pathology and Practice of Medicine Univ. of City of New York.

STEPHEN SMITH, M.D.,
Professor of Orthopœdic Surgery, University of the City of New York.

HENRY B. SANDS, M.D.,
Professor of Anatomy, College of Physicians and Surgeons.

JAMES R. WOOD, M.D., LL.D.,
Professor of Surgery, Bellevue Hospital Medical College.

LOUIS A. SAYRE, M.D.,
Prof. of Orthopœdic Surgery and Clinical Surgery, Bel. Hosp. Med. Col.

W. H. THOMPSON, M.D.,
Prof. of Materia Medica and Therapeutics, Univ. of City of New York.

LOUIS F. SASS, M.D.,

E. C. SEGUIN, M.D.,
Prof. of Diseases of the Mind and Nervous System, Col. Phy. and Surg.

C. HEITZMANN, M.D.,

J. L. LITTLE, M.D.,
Professor of Surgery, University of Vermont.

J. LEWIS SMITH, M.D.,
Late Clinical Lecturer on Diseases of Children, Bel. Hosp. Med. Col.

MONTROSE A. PALLEN, M.D.,
Professor of Gynæcology, University of City of New York.

The Wines will be shipped to any part of the United States.

Physicians wishing to test these Wines will, on application, be furnished with an original bottle at half price.

PRICE LIST:

FOOD IS THE BEST TONIC!!

MENSMAN'S

PEPTONIZED

BEEF TONIC.

TRADE MARK.

The great necessity for a fluid food that would possess **all the elements necessary for the support of the system**, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared for us by reliable and competant parties after a thoroughly tested and scientific method.

Extract of Malt

WITH

COD LIVER OIL.

Our Improved Extract of Malt with 50 per cent. of our fine Norwegian Oil, is pre-eminently THE emulsion of Cod Liver Oil, since it *has double the nutritive effect of any other emulsion of oil.* It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that IT UNITES PERFECTLY WITH WATER IN ANY PROPORTION, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

DOSE.—A Desert to Tablespoonful immediately after Meals.

" Taraxaci, in 1 lb. porcel. jars,					80c.
" Ferri Pomate, " " " "					$1 00

Prices inclusive of jars and bottles.

MATHIAS ROZSNYAY,

Arad, Hungary,

Begs leave to inform the Medical Profession that he has given his sole agency and the exclusive control of his preparation of

TASTELESS QUININE,

Neutral Tannate of Quinine,

To Mr. F. ALFRED REICHARDT, who keeps full stock of his preparations.

The discovery of Mr. Math. Rozsnyay to make an *absolutely tasteless and reliable* preparation of Quinine is one of the most important in modern therapeutics. The ordinary Tannate of Quinine, as made in chemical works, is obtained by precipitating the mother liquor, of which Quin. Sulphate has crystallized out, by an addition of Tannic Acid. First, this is an acid or bi-tannate, and contains likewise all the other Cinchorn Alkaloids. Quinidia, Cinchonidia, Cinchona, Quinlodin, etc., the little intrinsic value of which is best proven by the price lists of large German manufactrurers who quote this salt at only one-sixth of the value of the Sulphate. The *neutral* Tannate of Quinia has also great advantages over the Sulphate, as it does not cause the same cerebral and digestive troubles, as has been fully proved by the report of the commission appointed by the Academiè de Medicine, in Paris, on a memoir presented by Mr. Bonesiere. The commission consists of Messrs. Orfila, Bussy & Bouvier; their names are sufficient proof for the thoroughness of their researches.

I guarantee that this Neutral Tannate contains in 2½ grains the same percentage of pure Quinine as is contained in 1 grain of the Sulphate, and that its effects in equivalent doses are the same as that of the Sulphate. In treatment of diseases of children and persons of delicate taste, it is of the highest value. It is also put up in Chocolate Lozenges, containing each 2½ grs. of Tannate, 2 dos. in a box. Pamphlet sent free on application. Price per box, $1.00. Per ounce, $3.00.

FRANCIS J. GEIS,

Brewer and Maltster, Dobbs' Ferry, N. Y.,

PURE EXTRACT OF MALT.

Sole Agent for the U. S. and Canada, F. ALFRED REICHARDT.

This extract is absolutely pure and superior to **any other** make, foreign or domestic. Made without addition of hops, glucon, and guaranteed to be free from any substance whatsoever foreign to the best barley malt and distilled water. It is also the *cheapest* in the market. Put up in neat 1 lb. jars at 50c. per jar, or $3.75 per gallon, jar inclusive.

F. ALFRED REICHARDT,

Late Helmick, and Helmick & Co.,

Fluid Extract of Damiana.

The most effective preparation made under this name. It is a very efficient uterine tonic of the highest value in Impotency, Prostatitis, Spermatorrhœa, Suppressed Menses, and Catarrh of the Bladder. Its tonic action is as certain as that of Quinine. Put up in bottles of 6 oz. $2.00 per bottle. $16.00 per doz. Pamphlet sent gratis on application.

NITRITE OF AMYL PEARLS.

Made from Dr. E. Squibbs' Nitrite of Amyl. The only ones in the market of correct dosage. 2 and 3 drop, 75c. per doz. 5, 8 and 10 drop, $1.00 per doz.

IODOFORM, CRAYON'S.

Dr. Leblond's formula for Ulcerations of the Cervix. $1.00 per doz.

APIOL CAPSULES,

Absolutely pure. Containing 6 drops. The *only pure* of domestic make. $5.00 per 100.

BRUSH-HOLDING RUBBER STOPPLES.

90c. per doz.

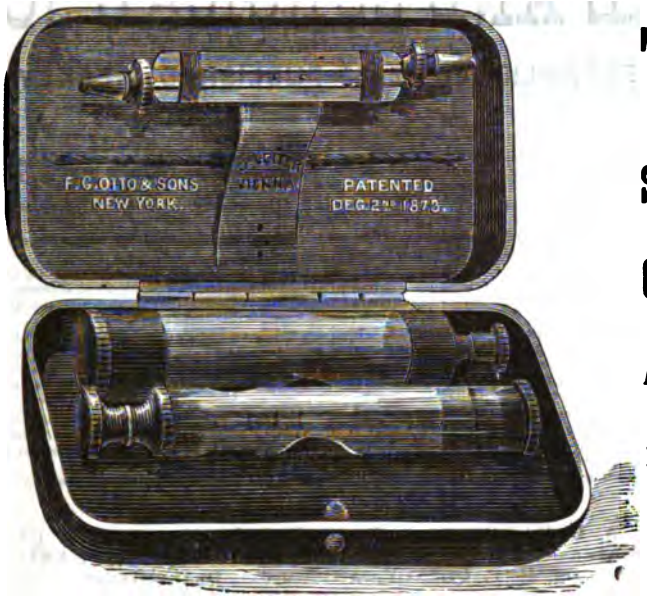
FOR THE

UNITED STATES.

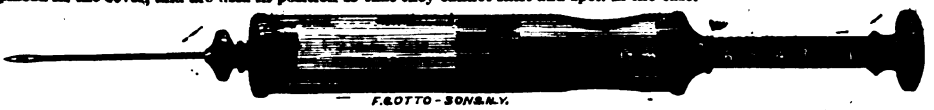


MANUFACTURERS
AND
IMPORTERS
OF
SURGICAL
AND
ORTHOPEDICAL
INSTRUMENTS,
Anatomical Preparations,
SKELETONS, &c.
Trusses, Abdominal Supporters, Elastic Stockings, &c., &c.

No instrument is used as often as the Hypodermic Syringe, and consequently they frequently get out of order. To furnish to the profession an instrument which can easily be kept in good working order, and which can be easily repaired, is our object of describing the following:

The instrument has two cannulas of steel, either gilt or nickel-plated; will not oxidize; they are tempered, and have an easily-introduced lance-shaped point, which can be easily sharpened. The diameter of the canula is ½ mm.

The Syringe is contained in a neat Hard Rubber case, the lower part of which holds the Syringe, and a vial of 5 grammes' capacity. The needles are placed in the cover, and are held in position so that they cannot shift and spoil in the case.



The advantages these Syringes possess over others may be briefly summarized as follows:

The construction of the cylinder out of hard rubber or glass, and the simple manner in which the different parts can be attached to another.

The construction of the stopple and the method of filling.

The manner in which the canulas are held in the case.

Dr. GAILLARD T. THOMAS, after examining the above instrument, pronounced the same to be one of the best improvements made in instruments since years.

Dr. G. R. PATTON, Lake City, Minn., writes: The Hypodermic Syringe came while I was away; I am pleased with it beyond expression.

PRICES.

The syringe with glass cylinder	$5 00
The syringe with glass cylinder, in a nickel-plated case, without a vial; very compact	3 50
The syringe with hard rubber cylinder	4 50

THE BOSTON

MEDICAL AND SURGICAL JOURNAL

ESTABLISHED 1828.—PUBLISHED WEEKLY.

THE Publishers of THE BOSTON MEDICAL AND SURGICAL JOURNAL wish to call the attention of physicians to certain special features of this journal which make it exceptionally valuable as a medical periodical, and which commend it to the favor of professional gentlemen throughout the United States.

1. It is a weekly publication, thus possessing obvious advantages for the prompt presentation of medical intelligence, a great part of whose value lies in its freshness.

2. Being the only medical publication in New England, it possesses unusual opportunities for obtaining contributions to its pages, and is able to combine the special advantages of both a weekly and a monthly journal.

3. It contains *nothing* but original material. There are no borrowed articles, the current literature of the day being represented, in a manner peculiar to this journal, by a series of reports by experts in special departments of medical science, who give comprehensive and critical summaries of the most recent advances in their respective branches, and who constitute undoubtedly the strongest corps of the kind in the country.

4. It gives special attention to the department of reviews, which are fuller and more carefully prepared than in most medical journals.

5. Reports are received from a large number of medical societies, representing all departments of medicine. The facilities for obtaining clinical contributions from hospital practice have been greatly enlarged, embracing the most important hospitals of New England.

6. The correspondents' department has been organized with great care, and the chief medical centres of the world are here represented. A letter from one of these places appears in each issue of the JOURNAL.

7. A weekly table, showing the comparative mortality rates for the week, of thirteen large cities in the United States

8. Editorially the JOURNAL aims to represent the profession of the whole country. It is one of the pioneers of medical science in the country, being, with one exception, the oldest now in existence. It was originated and has been maintained by no school or interest whatever beyond that of the science and practice of medicine and the medical profession.

The Editors and Publishers will spare no pains to keep the JOURNAL in the high and honorable position which it has so long occupied among American medical periodicals.

EDITOR.—DR. J. COLLINS WARREN.

EDITORIAL STAFF.—DR. A. D. MASON, DR. C. F. FOLSOM, DR. GEORGE B. SHATTUCK.

EDITORIAL REPORTERS.—DR. G. W. GAY, DR. F. W. GOSS, DR. HAMILTON OSGOOD.

DR. H. P. QUINCY, ANATOMICAL DRAUGHTSMAN.

THE REPORTERS ON MEDICAL PROGRESS in Anatomy, Chemistry, Dentistry, Dermatology, Diseases of Children, Diseases of the Throat and Chest, Electro-Therapeutics, Gynæcology, Materia Medica, Mental Diseases, Military Surgery, Obstetrics, Ophthalmology, Orthopedic Surgery, Otology, Pathology, Physiology, Public Hygiene and Forensic Medicine, Surgery, Syphilis, Theory and Practice of Medicine, and Genito-Urinary Surgery, comprise the principal Professors in the Medical School of Harvard University, and the leading Physicians and Surgeons in the Massachusetts General Hospital, Boston City Hospital, and Boston Lying-in Hospital.

TERMS.—*Five dollars a year*, payable in advance; single numbers *fifteen cents*. *Postage in all cases is paid by the Publishers.* Remittances may be made by draft, money-order, or registered letter to H. O. HOUGHTON & Co., *Riverside Press, Cambridge, Mass.*

A Compend of Diagnosis in Pathological Anatomy

With Directions for Making Post Mortem Examinations. By Dr. JOHANNES ORTH. Translated by G. K. SABINE, M.D., and F. C. SHATTUCK, M.D. Revised by R. H. FITZ, M.D. In one volume, 8vo, cloth, $3.50.

In issuing a translation of this recent German work, the publishers have been convinced of its great practical value to all medical students. The directions for making an autopsy are given with great thoroughness and precision; the means of recognizing the various changes which may be found on the different parts of the body are briefly stated in a systematic manner, and the medico-legal bearing of the results of the investigation are always carefully attended to. The description of the gross appearances is also supplemented by thoroughly practical directions in the use of the microscope, when important additional information becomes necessary for exact diagnosis.

Dr. Orth was formerly the assistant of Professor Rindfleisch, and at present holds a like position under Professor Virchow. The teaching which he offers is consequently that of the highest authorities in the very centre of modern investigation in this department of medicine.

The Publishers are the more desirous of calling attention to the translation, as it contains, through the kindness of the author, such additional information and corrections as he has prepared for the second edition of the original work, hereafter to be published. They have received many letters from prominent physicians and surgeons, warmly commending the book, and among them the following:

COLLEGE OF MEDICINE, SYRACUSE UNIVERSITY,
SYRACUSE, N. Y., *December* 5, 1877.

Every physician should carefully read the admirable work of Prof. Orth on "Diagnosis in Pathological Anatomy." For this book teaches —what so few know—how to make a neat *sectio cadaveris*. Prepared by a pupil of Virchow, the greatest pathologist in the world, it is not only fascinating, but authoritative on all points which it discusses. Cleverly translated, the book is one of the best additions to the best recent medical literature. I thank you for the copy sent me. I heartily commend it to my classes, and to my professional brethren here and everywhere.

H. D. DIDAMA.

PHILADELPHIA, *December* 7, 1877.

I have delayed the acknowledgment of the handsome translation of Orth's "Diagnosis in Pathological Anatomy," which you so kindly sent me, until I had time to read it carefully. Its clear and brief, but comprehensive, descriptions of the downright facts of pathology are almost unsurpassed, and although I am at present teaching normal histology, I shall have and use many opportunities of recommending this work to our students.

JOS. G. RICHARDSON.

*** *For sale by Booksellers and by the Publishers,*

HURD AND HOUGHTON, 13 ASTOR PLACE, NEW YORK.

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is generally preferred; or of an **elixir**, when a slight stimulant is desired.

Durel's Syrup of Tar and Iron.

Prepared by DUREL, Pharmacist, Paris.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron, is a desideratum which has at last been attained in this preparation. The indications for such a remedy are many, but it has been found especially useful in ***Chlorosis, Bronchial Catarrh, Catarrh of the Bladder, Chronic Uterine Discharges***, depending upon an enfeebled or relaxed state of the system.

It is sold by chemists generally.

E. FOUGERA & CO.'S

MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of Ether; Chloroform; Oil of Turpentine; Apiol;
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

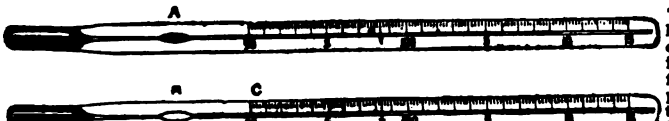
Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Pharmacien, No. 40 Rue Bonaparte, Paris,
without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $7 00

We also offer:

No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 5 00
No. 1. Casella's Clinical Thermometer for Hospital use, four or six inch, in neat pocket case..... 3 50

Sent free by mail on receipt of price. Manufactured by L. CASELLA, London.

TO PHYSICIANS.

THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving results of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

TOTAL ABSTINENCE SAVING WINE TILL IT RIPENS.

There is a curious story about some native wines which are extensively advertised nowadays, and have only recently been put upon the market. Dr. Underhill, the well-known grape-grower of Croton Point, died in 1871. Some of his heirs entertained temperance views of such extreme kind, that they were unwilling to allow the stock of wines then on hand to be sold or any more to be made. The grapes have sometimes been sent to market, and sometimes left to decay upon the vines. It is only now that the other heirs have succeeded in arranging for a settlement of the estate and the sale of the wines on hand. Among these is a wine of the vintage of 1864, described as a "Sweet Union Port," but suggesting the Imperial Tokay more than any other European wine, and being wholly unlike any other wine of American growth. Its purity, age and mellowness are remarkable, and both physicians and wine-fanciers have a special interest in it as the oldest native wine now accessible in any considerable quantity. The whole stock is in the hands of the well-known wholesale grocery house of the Thurbers.—*N. Y. Tribune, Nov.* 19, 1877.

The above speaks for itself; but we would add that this is the pure juice of the grape, neither *drugged, liquored* nor *watered;* that it has been ripened and mellowed by age, and for medicinal or sacramental purposes, it is unsurpassed. It can be obtained from most of the leading Druggists throughout the United States, and at wholesale from the undersigned, who will forward descriptive pamphlet, free of charge, on application.

Respectfully, etc.,

JOSEPH W. HOWE, M.D.,
Clinical Professor of Surgery.

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 19, 1877, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Third of October, 1877, and end about the 1st of March, 1878.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals, with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted to *all the Clinics* given therein, *free of charge.*

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Demonstrator's fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	30 00

For further particulars and circulars, address the Dean,

Prof. CHAS. INSLEE PARDEE, M.D.,

University Medical College, 410 East 26th St., New York City.

UNIVERSITY OF VERMONT.

MEDICAL DEPARTMENT,

BURLINGTON, VT.

TWENTY-FIFTH SESSION, 1878.

FACULTY OF MEDICINE.

MATTHEW HENRY BUCKHAM, A.M., D.D., BURLINGTON, VT., President.

SAMUEL WHITE THAYER, M.D., LL.D., BURLINGTON, VT., Emeritus Professor of General and Special Anatomy; Consulting Surgeon to Mary Fletcher Hospital.

WALTER CARPENTER, M.D., BURLINGTON, VT., Professor of the Theory and Practice of Medicine; Physician-in-Chief to Mary Fletcher Hospital.

JOHN ORDRONAUX, M.D., LL.D., NEW YORK CITY, Emeritus Professor of Medical Jurisprudence.

WILLIAM DARLING, A.M., M.D., F.R.C.S., NEW YORK CITY, Professor of General and Special Anatomy.

A. F. A. KING, M.D., WASHINGTON, D. C., Professor of Obstetrics and Diseases of Women: Consulting Physician to Mary Fletcher Hospital.

HENRY D. HOLTON, M.D., BRATTLEBORO, VT., Professor of Materia Medica and General Pathology; Consulting Surgeon to Mary Fletcher Hospital.

MARSHALL CALKINS, A.M., M.D., SPRINGFIELD, MASS., Professor of Physiology and Microscopic Anatomy.

JAMES L. LITTLE, M.D., NEW YORK CITY, Professor of the Principles and Practice of Surgery; Surgeon-in-Chief to Mary Fletcher Hospital.

GEORGE S. SMYTH, Ph.D., University Professor of Chemistry and Toxicology.

PROFESSORS OF SPECIAL SUBJECTS.

WILLIAM A. HAMMOND, M.D., NEW YORK CITY, Professor of Diseases of the Mind and Nervous System.

ROBERT W. TAYLOR, M.D., NEW YORK CITY, Professor of Diseases of the Skin.

A. P. GRINNELL, M.D., BURLINGTON, VT., Professor of Diseases of the Heart and Lungs; Attending Physician to Mary Fletcher Hospital.

STEPHEN M. ROBERTS, M.D., NEW YORK CITY, Professor of Diseases of Children.

A. T. WOODWARD, M.D., BRANDON, VT., Professor of the Surgical Diseases of Women: Consulting Physician to Mary Fletcher Hospital.

EDWARD S. PECK, A.M., M.D., BURLINGTON, VT., Professor of Diseases of the Eye and Ear.

LEROY M. BINGHAM, M.D., BURLINGTON, VT., Demonstrator of Anatomy; Attending Surgeon to Mary Fletcher Hospital.

THIS Medical College is situated near the University buildings, and upon an eminence overlooking the city of Burlington, Lake Champlain, and the Adirondack chain of mountains. For beauty of scenery and salubrity of climate its situation is not surpassed by any Institution of learning in the country. The building is of brick, well ventilated, and provided with two commodious lecture-rooms and amphitheatre, two large well lighted dissecting-rooms, and in every way perfectly adapted for clinical and scholastic teaching. It contains a large museum, composed of a great number of Osteological and Vascular preparations, both wet and dry, and is open to the students during the session.

HOSPITAL ADVANTAGES. The Mary Fletcher Hospital, now in progress of erection, will probably be ready to receive patients before the next regular session.

Clinical instruction in Medicine, Obstetrics, and Surgery, will be given during the regular course of lectures, by the Professors of the Medical Department of the University.

THE REGULAR WINTER SESSION will commence on the first Thursday of March, 1878, and continue sixteen weeks. This course will consist of from five to six Lectures daily, in the various Departments of Medicine and Surgery.

In order to render the course of instruction still more complete, six new Professorships on special subjects have been created by the Faculty since the close of the last session, which will afford the student a rare opportunity for gaining information from gentlemen well known as recognized authorities in their particular departments on subjects of great practical interest. These lectures will be delivered during the regular session.

CLINIQUES. Besides these Lectures, there will be Cliniques held as follows:

SURGICAL CLINIQUE, by Prof. LITTLE, every Saturday, from 9 to 12, during the last half of the Session.

MEDICAL CLINIQUE, by Prof. CARPENTER, on Wednesday morning, during the first half of the term.

CLINIQUE FOR DISEASES OF EYE AND EAR, by Prof. PECK, during his course of Lectures

CLINIQUE FOR DISEASES OF SKIN, by Prof. TAYLOR, during his course.

CLINIQUE FOR DISEASES OF CHILDREN, by Prof. ROBERTS.

CLINIQUE FOR DISEASES OF NERVOUS SYSTEM, by Prof HAMMOND, during his course of Lectures.

FEES FOR THE REGULAR SESSION.

Matriculation Fee, Payable each Term,	$5.00
Fees for the full Course of Lectures by all the Professors,	70.00
Graduation Fee,	25.00

Material for dissection will be furnished at cost.

The tickets are to be taken out at the beginning of the Session.

Students who have already attended two full courses of lectures in other regular schools, are admitted on paying the Matriculation fee and $25.

Students who have attended two full courses in this College, or who, having attended one full course in some regularly established medical school and one full course in this College, are admitted to a third course of lectures on paying the matriculation fee only.

GRADUATES of this school are admitted without fee. GRADUATES of other regular schools, and *Theologica Students*, are admitted on general ticket, by paying the matriculation fee.

Good Board can be obtained at reasonable rates.

For further particulars and circular, apply to the Secretary,

Prof. A. P. GRINNELL, M.D., Burlington, Vt.

ANNOUNCEMENT.

Over 200 pages additional Reading Matter in a year, with no change in price, making two royal octavo volumes of 520 pages each.

THE MEDICAL RECORD.

A Weekly Journal of Medicine and Surgery.

Edited by GEORGE F. SHRADY, A.M., M.D.

The publishers have the pleasure of announcing that, beginning with the first number for January, 1878, THE MEDICAL RECORD will be enlarged by the addition of *four pages* each week, amounting to

OVER 200 PAGES ADDITIONAL READING MATTER

In a year—with NO CHANGE IN PRICE. This very great increase in the size of the journal has been rendered possible by the large advertising patronage enjoyed by it, and is a direct benefit to subscribers from this source. An increased number of advertising pages never costs subscribers any thing, never encroaches upon the reading matter, which is invariably the same each week, and should always be viewed by readers with satisfaction, as an evidence of the prosperity of the journal, and its greater ability to provide for them.

"THE MEDICAL RECORD"

For 1878 will, therefore, consist of TWO ROYAL OCTAVO VOLUMES of 520 pages each. Subscription price, $5.00 per year, *invariably in advance.*

The Volume commences January 1st.

This Journal, now in its thirteenth volume, is published on Saturday of each week; each number consists of twenty super-royal octavo pages, double columns, and contains Original Articles from the first men of the country in their respective departments, Reports of Lectures, Societies, and Hospital; an account of the Progress of Medical Science throughout the world; Editorial Articles on Current Topics of Interest, Reviews and Notices of Books, Correspondence. New Instruments, Medical News and Items, &c., &c.

It is the only WEEKLY MEDICAL JOURNAL published in NEW YORK.

The Medical Record is intended to be thoroughly Cosmopolitan in its character, representing the interests of the profession in all parts of the country. It is entirely independent of all parties or cliques. Its object is to present to the profession a faithful record of the existing state of medical science in all its departments; and, as it is more especialy intended to meet the wants of the general practitioner, the articles published in its columns are thoroughly practical in their character.

SPECIMEN COPY SENT FREE.

THE TWO JOURNALS WILL BE SENT FOR NINE DOLLARS A YEAR.

An increase of 200 pages additional Reading Matter in a year will be made in

THE AMERICAN JOURNAL OF OBSTETRICS

And Diseases of Women and Children.

PAUL F. MUNDÉ, M.D., Editor.

In consequence of the great increase in the number of subscribers to the AMERICAN JOURNAL OF OBSTETRICS the past year or two, the Publishers take pleasure in announcing that, beginning with January, 1878 (Vol. XI., No. 1.), they will permanently increase each number by *fifty additional pages*, thus giving its subscribers annually about

ONE-THIRD MORE READING MATTER

than heretofore, or, a volume of 896 large octavo pages with *no change in the subscription price.*

An increased number of illustrations, both wood engravings and lithographed plates, may also be expected in future volumes.

While the prosperity of the AMERICAN JOURNAL OF OBSTETRICS, and this consequent substantial evidence of it, cannot fail to be gratifying to all its subscribers and other friends, the Publishers trust the Medical Profession will take this voluntary action on their part as an earnest of their desire and intention, so far as in their power, to make all their publications merit the liberal support which is given them.

Subscription Price, $5.00 per year, invariably in advance.

☞ If any subscriber has a friend to whose notice he would like to commend the Journal, the Publishers will be pleased to mail a Specimen Copy to any address furnished them.

WM. WOOD & CO., Publishers, 27 Great Jones Street, New York.

In corresponding with Advertisers please mention **The Medical Record.**

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMITH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

Digitalia.....1-60 gr.	**Sulphur, Iodide**.....1-25, 1-10 gr.
This is prepared in our own laboratory and can be confidently relied upon.	**Tartar Emetic**.....1-100, 1-20, 1-4 gr.
Mercury, Bin-Iodide.....1-25, 1-16 gr.	**Zinc, Phosphide**.....1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

Quote MEDICAL RECORD.

The Medical Society of the State of New York

Will hold its Seventy-second Annual Meeting, at Albany, N. Y., on Tuesday, January 15th, 1878, commencing at 11 A.M.

WM. MANLIUS SMITH, *Secretary.*

CARNIER, LAMOUREUX & CIE.,

213 RUE ST. HONORÉ, PARIS,

Beg leave to inform the profession that Mr. F. ALFRED REICHARDT, 404 Fourth Avenue, N. Y., is their Sole Agent, and keeps a full stock of their Sugar-Coated Pills and other goods on hand.

Referring to above, I beg leave to call the attention of the profession to the goods made by Messrs G., L. & Co., of Paris. They are the first house which made Sugar-Coated Pills a specialty, and their goods were introduced twenty-five years ago into the United States. Their goods are superior in finish and quality to any other made. They use no coating between pill mass and sugar, and all their pill masses are easily soluble. **Their list prices to physicians are lower than other makers,** and their goods more reliable.

The latest additions to their list are: Dragees of Crystal; Valerianate of Ammonia, without taste or smell, 2 grains; Citrate of Coffein, ½ grain; Monobromide of Camphor, 2½ grains; Codeia, 1-5 grain; Crotors Chloral (Liebreich's), 2½ grains; Cynoglosse or Pil. Nepenthe; Diascordium; Extract Eucalyptus, 2½ grains; Malate or Pomate of Iron; do., with ½ grain Extr. Nux Vomica; Extr. Gilsemium; Drag. Meglin; Quin. and Ferri Citras, (20% Quins.) 2 grains; Tonic Aperient; also the already well-known Granli Proto-Iodide Mercury, 1-5 grain, and Dr. Francis' Triplex Pills.

Goods sent free by mail on receipt of list price. Please send for Price List and Descriptive Pamphlet, mailed free on application.

F. ALFRED REICHARDT, Pharmacist and Importer, 404 Fourth Avenue.

ALOIN, { THE ACTIVE PRINCIPLE OF ALOES.

MANUFACTURED BY THE DISCOVERERS,

T. & H. SMITH & CO., Edinburgh and London.

"The uniformity in strength of Aloin, the smallness of its dose, and the certainty of its action should commend it to the favourable consideration of all medical practitioners."—*Vide* Dr. WM. CRAIG's Investigations, published in *Edinburgh Medical Journal* for May, 1875.

Messrs. SMITH will send free by post a Sample of Aloin to any Medical Gentleman desiring it.

THE TREATMENT OF DIPHTHERIA.

By C. E. BILLINGTON, M.D.,

VISITING PHYSICIAN TO DEMILT DISPENSARY.

In this paper will be presented the method and the results of the treatment of diphtheria in the north district of Demilt Dispensary during the past three years, with some accompanying observations and corroborative facts. This will necessarily include a brief recapitulation of some statements that have previously been published (Transactions of the New York Academy of Medicine for 1876, page 286). Except in the form of brief abstracts, they have come into the hands of only a comparatively limited number of the profession. It may, perhaps, be admitted that their practical importance renders them worthy of general consideration.

In 1869 I was appointed (out-door) visiting physician to Demilt Dispensary. I had previously become, by some sad experiences, intensely interested in the problem involved in diphtheria—a problem in regard to which the confusion of the young practitioner could only be "worse confounded" by the chaos of conflicting solutions afforded by the literature of the subject. I therefore eagerly availed myself of the opportunities of studying it which occurred in increasing numbers each year in this service.

I indulge in so much of personal history to show that the beliefs and the practice with which I was prepared to encounter the great epidemic of 1875, were no recently formed conclusions—bore no relation to any theories of others, "bacterian" or otherwise; but rested on the solid basis of induction from independent, careful, and oft-repeated clinical observations.

The most important of these beliefs was, that diphtheria is, to all practical intents at least, primarily a local disease, becoming constitutional only by absorption. Some of my reasons for this belief may be found in the paper above referred to; others, in the New York MEDICAL RECORD, March 3, 1877, page 140, and still others may at some future time be published.

This view suggested the development of an appropriate method of treatment, and was in turn corroborated by its results—as strikingly in cases of failure as in those of success.

I shall first present the method of treatment. Simple as it is, it was the result of many anxious trials of a variety of agents in various combinations through alternate success and failure for several years preceding 1875.

That I had, during this period, ample opportunities to become familiar with the *diagnosis* of the disease in question, will hardly be disputed.

For the *rationale* of the employment of these combinations I must refer the reader to my previously published paper.

FORMULÆ.

No. 1. *Iron and Glycerine Mixture.*

℞. Tinct. ferri chloridi..... fl. ʒ i.— ʒ iss.
Glycerinæ,
Aquæ ..... aā fl. ℥ i.
M.

No. 2. *Chlorate of Potash Mixture.*

℞. Potassæ chloratis..... ʒ ss.— ʒ i.
Glycerinæ..... fl. ℥ ss.
Aquæ calcis..... fl. ℥ ijss.
M.

The weaker strength indicated of both mixtures is the one I generally employ.

I formerly used for a time and published as a substitute for No. 2, a combination of salicylic acid, ℈i.; sulphite of soda, ʒ i.; glycerine, ℥ ss.; water ℥ ijss. As this is less pleasant than No. 2, and probably no more efficacious, I have discontinued its use.

No. 3. *Spray Mixture.*

℞. Acidi carbolici..... ♏xv.
Aquæ calcis..... fl. ℥ vi.
M.

To be used with a small hand atomizer, which I much prefer to the steam apparatus. Codman & Shurtleff's No. 56 is the most convenient. This mixture is more pleasant and less irritating, and probably more efficacious, than the more complex and stronger ones which have lately been much used. It is of unquestionable utility in laryngeal implication. Its pleasantness any one can test by throwing it in spray into his own mouth and throat.

RULES FOR TREATMENT.

I.—Give a teaspoonful of No. 1 and of No. 2 alternately, every half-hour, except at night, when the patient may be allowed to sleep for an hour or two at a time.

II.—Spray the throat with No. 3 for several minutes at a time whenever the above mixtures are given—that is, every half hour. It is essential that the nurse be carefully instructed in the proper method of doing this. The mouth must be opened widely. When the child is too young to do this, the spraying must be omitted.

III.—When there is nasal implication, the nose should be thoroughly syringed out with warm or tepid salt water, once, twice, or three times a day. I have lately employed no other agent. It should be done with the patient's head inclined forward, after the method which is described in my above-mentioned paper. It is very important that the physician know how to do this well, and, generally, *do it himself.* I have always used a two-ounce hard-rubber ear-syringe. It is absolutely essential that this have a suitable nozzle, which is not always the case.

IV.—Do not (as a rule) apply any brush or swab to the throat. I sometimes throw a drachm of No. 1, with a syringe, directly against the affected surface in the throat.

V.—Do not (as a rule) give any quinine or other unpleasant medicine to children. This rule is of great practical importance.

VI.—Do not (as a rule) give alcoholic stimulants. Call this rank heresy—as the majority will! It is none the less true that your success will be greater without them. There are, of course, a few exceptions; those are the cases where a child that cannot be induced to take other nourishment, will take weak milk-punch or eggnog.

VII.—Nourish the patient with an abundance of cold milk, given frequently, to which a little lime-water may often advantageously be added. This rule is of the greatest importance. Even a bad case may be regarded favorably while the patient continues to take nourishment well. When the stage of extreme exhaustion has been reached in bad cases, juice

squeezed from beefsteak is a valuable addition to the bill of fare.

Simple as this method of treatment seems, its successful application in bad or protracted cases will require much skill, tact, energy, and perseverance. Let tadpny who may at first fail in its employment hasten eto ecide that the method is at fault. The efficacy of water in extinguishing fire is undisputed. There are, nevertheless, many instances of its unsuccessful application.

In my previous paper on this subject I used the following language, which some instances that have since come to my knowledge have shown to be prophetic:

"If any shall adopt some of my methods, only to make them *part* of a treatment in which quinine, alcohol, etc., or topical brushing enter, I predict that they will be the very ones who will pronounce my system a failure."

The reviewer of a leading medical journal failed to find anything very distinctive in my method of treatment, because the drugs employed in it had previously been in general use. I specify the following as distinctive features: 1, the combinations, which are especially simple, pleasant, harmless, and efficacious; 2, the convenient and unirritating methods of their application; 3, the frequency of their application. For others I refer back to rules IV., V., and VI.

The results of this method in 124 cases treated by me from the Dispensary, in 1875, were stated by me as follows:

"Of these 124 patients, 94 recovered and 30 died—$24\frac{2}{10}$ per cent.

"That this rate of mortality is at least fifteen per cent. less than the average from genuine cases of diphtheria during that year in that district will, I think, be admitted by those best qualified to judge; though in the absence of full and accurate returns of the number of cases it would be impossible to prove it statistically. But it yet gives no idea of the actual results of my treatment, which I fortunately can show statistically and accurately.

"Of the 124 cases, 22 passed under the care of other physicians, in most instances after a single visit only, and, in some, without the medicine I prescribed having been procured, leaving 102 that continued under my treatment. Of the 102 that continued under my treatment, 88 recovered and 14 died.

"Of the 22 who passed under the treatment of others, six recovered and 16 died. The extreme badness of these latter results is partly to be accounted for by the fact that some of them were hopeless, and others severe cases, for which, on account of my unfavorable prognosis, other medical aid was called in.

"This is not, however, true of all, fully half of them having been by no means bad when I saw them. Some of them left my care through dissatisfaction at my not using topical applications. The results, in such cases, as I have since learned them, were particularly bad.

"Of the fourteen who died under my care, one was moribund when first seen, surviving only two hours; one was already a hopeless case of laryngeal croup; two others were hopeless cases from extensive membranous affection and marked indications of blood-poisoning. Deducting these, leaves ten deaths out of 98 cases in which the treatment was tested with some degree of fairness, or a little over ten per cent."

These results were obtained under all the well-known disadvantages that attend Dispensary practice, and in a region which, as I showed statistically from the returns of the Board of Health, gave in that year a larger mortality from the disease in proportion to population than any ward in the city.

With the above I reported still better results obtained by this method of treatment in private practice, which I will not recapitulate here.

That results so favorable should excite incredulity was to be expected. One zealous disputant asserted publicly in opposition to my explicit statements and the probabilities, that my cases must have been "exceptionally mild" ones. The precise opposite was the fact. I cannot, however, deny that my cases may have been, *after a few days of treatment*, exceptionally mild as compared with some others.

From this *résumé* of results already published, I now proceed to those of the following year, 1876. In that year I treated from the Dispensary, 37 cases, of which 29 occurred in the first four months. Then the epidemic quite suddenly abated, and only eight were seen in the remainder of the year.

Of these 37 cases, three passed, after a single visit, under other medical care—with what results I do not know; five others died, and 29 recovered.

Of the five that died, one, aged two and a half years, was moribund with laryngeal croup when first seen, dying in less than ten hours afterward. The only possible remedy, tracheotomy, was refused.

In another case which was bad, but not hopeless, when first seen, I returned on the second day to find the patient moribund. The parents, who were extraordinary specimens of perverse stupidity, acknowledged that they had not used the remedies furnished them, an old woman having told them that the spray would injure the child's eyes! I may here mention that I have in many instances, scarcely more favorable than this in respect to nursing, made up for the deficiency by very frequent visits on the part of myself or my assistants; otherwise I never could have obtained the results I have. In this instance, other engagements made this impossible.

Deducting from the five deaths these two cases in which the treatment was not employed, leaves three deaths out of 32 cases in which it was tested; or, again, a little less than ten per cent.

Among the twenty-nine cases that recovered were a full quota of severe ones, and four were among the very worst that were ever known to recover, as can be attested by competent medical witnesses. I condense a brief account of one of these from notes taken at the time:

Ann McFall, aged three years, 606 Second avenue, March 21, 1876. When first seen, great inflammation and swelling of the fauces; membrane on both tonsils and over soft palate; much enlargement of cervical glands. Extreme nasal affection with profuse sanious muco-purulent discharge; excoriated nostrils and upper lip, and obstructed breathing. A great degree of blood-poisoning was evident from the characteristic hue and expression.

Expecting her death before the next day, treatment was nevertheless begun. The nose was thoroughly cleansed out two or three times every day by syringing with warm salt water, in which I was kindly assisted by Dr. D. C. Comstock. This proceeding was always followed by freer respiration and improved hue of complexion. The one favorable symptom was that the child could be induced to take milk quite freely.

The condition of the patient continued about the same for six days, the membrane having disappeared from the tonsils, but continuing on the faucial arch and uvula, and a large patch having formed on the tongue.

On the 27th the case was seen by Dr. W. T. White, who predicted its fatal termination. For the next five days the patient's condition continued critical, but gradually improved under the use of the same means, which were employed altogether for two weeks before the patient was considered out of danger. This case was repeatedly seen by Dr. W. E. Bullard.

Few cases giving so much evidence of constitutional poisoning as this did, recover. It is to be noted that it was treated without stimulants or quinine.

Over-zealous advocacy may be of great injury to a good cause. I therefore say explicitly that I do not claim that such extremely bad cases as the above can, as a rule, be cured. Constitutional vigor is an important factor, and sometimes of itself produces remarkable recoveries under all kinds of treatment. I do, however, believe, from not a few similar experiences, that this method, when effectively applied, gives, in all such cases, the best, and in some, the only chance of recovery.

It would be unpardonable forgetfulness should I fail to record my great obligations for most valuable assistance in the above-mentioned labors to Dr. D. C. Comstock, and to Dr. W. E. Bullard, who is now visiting physician to the south district of this Dispensary.

Aware that the endless repetition of statistics of cures resting mainly on my own unsupported assertions, could add little to the weight of the original ones, I adopted at the beginning of the past year (1877) the plan of having the cases occurring in my Dispensary service seen and the diagnosis verified by competent, disinterested, and well-known witnesses. Seventeen cases thus occurred during the year. I reserve the details of these cases and their results, with interesting and instructive facts connected with them, for publication when the number of such attested cases shall have become sufficiently large to be authoritative. I will only state at present that most of these cases have been kindly seen either by Dr. W. T. White or Dr. Andrew H. Smith, and that the previous ratio of recoveries has been more than maintained.

I have frequently learned with much gratification that the method of treatment which I have used and advocated, has proved successful in the hands of other physicians. No such instance has given me quite so much pleasure as was afforded by the receipt of the following letters from a stranger. The first one came to me in December last at the Demilt Dispensary. I transcribe it nearly in full, *verbatim et literatim*.

"FREDERICTON, NEW BRUNSWICK,
DOMINION CANADA, Dec. 5th, 1877.

"MY DEAR SIR:

. . . . . .

"In September, 1876, when on my way to Philadelphia to the exhibition, and to again visit the city in which I graduated seventeen years ago, I called in New York on my friend and college mate, Dr. Edward Bradley. I observed on his table your pamphlet on diphtheria. I told him I must read it, having, I believed, had greater experience in that disease than any physician in our Province. I brought it with me, and strange to say, we have not had a visit of the disease in this city till this fall. The first cases did not occur in my families. They nearly all ended fatally. The first I had to treat was my only son, aged fourteen years. He took the disease on the fifth day of his having mumps. In two hours after the first symptoms the whole throat was well covered with false membrane, and he sank at once into a drowsy state, from which he could be roused only with difficulty, the false membrane spreading rapidly. He was just such a case as was occurring in the city every day, and ending fatally in about two days.

"I took your treatment and followed it to the letter. In twelve hours he was much improved; in twenty-four, throat quite clear, and he seemed bright and asked for food. In forty-eight hours there was not a speck of false membrane in his throat and has not been since. This is the fifth day. He is up about his room now, and took a good dinner of beefsteak. I really feel much indebted to you, and thought I must just say so to you. I cannot but think that had it not been for my good fortune in seeing your pamphlet, to-day would have been the day I should have had to bury my son.

"I have had to treat the disease, I think, oftener than any physician in this city, and am regarded by many as having better fortune than any of my brothers, but I feel that the best I have ever done is far inferior to your treatment.

. . . . . .

"May I ask you to forward me your treatment for adults? About one-fifth of our cases are young men and women.

"I have now been put pretty busily at work with this disease, and feel confident that all are going to do well that I can have nursed well.

. . . . . .

"Yours, very respectfully,
T. CLOWES BROWN."

I replied that my treatment of adults differs little from that of children, consisting generally of the administration of Number 1 every hour or half-hour, with very frequent spraying. To this may be added, when indicated, the use of such gargles as a solution of mel. boracis, or of a little alum in sage tea, or the salicylic acid mixture, of which the formula is given above.

I also requested Dr. Brown to favor me with the results in his other cases, and to permit me to publish them with the interesting case of his son.

I received the following reply, dated Dec. 18th:

. . . . . .

"Since the case of my son I have had to treat a number of cases of diphtheria, with the best possible result in every one.

"The most malignant case I have had was fortunately my next-door neighbor, a boy aged 13 years. He was ill with a cold about two days, when throat symptoms showed themselves. I at once adopted your treatment—the iron and glycerine mixture, the salicylic acid and soda mixture, and spraying the throat; but in spite of the best nursing I could desire to have, and giving the case nearly hourly attention, it went from bad to worse until the fifth day; then for two days it did not seem that he could recover. He must have suffocated at different times had I not with dressing-scissors removed the partially detached portions of false membrane. At one time I took from his throat a portion of false membrane as large as your twenty-five cent piece and as thick as my little finger. This, for the time, gave great relief. The next day he must have smothered had I not removed the whole palate, which was one solid portion of false membrane as large and long as my little finger to the middle joint. The next day I had the throat clean. Since that time, once in twenty-four hours, it would re-coat itself, and the spraying would remove it—each day the coating getting thinner. He is now well, looks bright, and throat clear

but could you see it, you would not say he had elongation of the uvula!

. . . . . .

"I have seen diphtheria in all forms, but never a worse case than this. I have seen whole families carried to the grave in one week with exactly the same type of the disease this boy had, and I believe he was saved by the iron and spraying. I just followed it up and awaited the result.

"Diphtheria has raged here this fall, nearly leaving childless some families. All plans of treatment have been tried; some relying on the sulpho-carbolate of soda, some on the strong acids, others on carbolic acid; but, to my mind, your treatment in our present state of knowledge cannot be equalled."

. . . . . .

I feel greatly indebted to Dr. Brown for these letters and for his permission to make use of them for the following reasons: First, his large experience with the disease enables him to speak with authority of cases and their types. Second, they illustrate the efficacy of this method of treatment, not merely in cases of diphtheria occurring in this city, but in a malignant epidemic in a remote region. Third, the perseverance with which Dr. Brown "just followed it up and awaited the result" in his worst case through seven discouraging days is noteworthy. It is too common to hear a physician, after treating a fatal case of diphtheria, say "*everything* was tried!" Fourth, the close personal attention, and the skill, dexterity, and judgment in the management of that case that are evident in the doctor's unpretentious narrative, show that my method, as carried out by him, was like good tools in the hands of a master-workman. Vacillation, lack of energy, and want of tact and skill, may easily bring discredit upon the best method of treatment in a disease of such critical emergencies as is diphtheria in its bad forms. Fifth, the types of the two cases described in these letters are worthy of consideration. Although the doctor was doubtless right in regarding the former as malignant and of rapidly fatal portent, yet the exudation was evidently comparatively superficial, as was shown by its yielding so readily to proper treatment. The disappearance of the marked constitutional symptoms with that of the exudation is also noteworthy—illustrating the dependence of the former upon the latter. In the second case the exudation was deep in the tissues as well as thick and extensive. Such cases are the most formidable of all. Rapid removal of the membrane or its complete disinfection is impossible. The greater difficulty and the occasional failures in dealing with such cases, however, simply confirm the lesson taught by the other class as to the nature and the only useful treatment of the disease. Sixth, the age of these patients was the one favorable circumstance. Had it been under three years, such intensity of disease must have been almost necessarily fatal for the following reasons: the absorbents are at that age very active; and the resistance that is offered to throat-spraying and other necessary manipulations is a formidable obstacle to treatment. The very failures of the antiseptic method, when intelligently considered, furnish strong confirmation of the great principle that demands its employment.

The few remaining copies of my pamphlet will be gladly furnished, on application, to physicians who may wish to test this method of treatment in an actual epidemic of the disease.

Those who have fairly tested it in a number of cases, or who may hereafter do so, are earnestly requested to communicate to me the results obtained.

157 LEXINGTON AVENUE, NEW YORK.

CERTAIN GENERAL CONSIDERATIONS

RESPECTING THE

MECHANICAL TREATMENT OF CHRONIC DISEASES OF THE JOINTS,

WITH ESPECIAL REFERENCE TO THE USE OF TRACTION.*

BY L. M. YALE, M.D.,

SURGEON TO BELLEVUE HOSPITAL; LECTURER ADJUNCT UPON ORTHOPŒDIC SURGERY IN THE BELLEVUE HOSPITAL MEDICAL COLLEGE.

AT the present time, in this country at least, the use of some form of mechanical appliance is very generally recognized as a proper part of the treatment of a chronic joint inflammation. The form, the principle of action even, of this appliance, will vary with the ingenuity and the pathological views of the practitioner, but the striking fact is that each endeavors to accomplish the cure by the use of an agent the action of which upon the diseased articulation is directly mechanical as distinguished from medicinal. I say striking, because such practice is not only at variance with, but to a great degree is a reaction against, that considered thoroughly established a generation, or less than a generation ago. Mechanical treatment in the sense and for the purposes that it is now used is of very recent date, and its introduction into general use is the work of men still living. The treatment which it has in part displaced, was that based upon the theory of the exclusively constitutional origin of all chronic arthropathies. Any chronic indolent joint inflammation not evidently due to the rheumatic, the gouty, or the syphilitic taint was judged to have its origin certainly in the scrofulous diathesis. The inference directly followed that a diathetic disease could be successfully met by constitutional remedies alone. The judiciousness of meeting the arthritic expression of the diathesis by appropriate local surgical treatment was rarely appreciated, and the management of a diseased joint was generally as purely medical as that of a strumous adenitis for example; amputation in the one instance, extirpation in the other, being resorted to when medical resources had failed.

Probably the more practical surgeons always resorted to local support of a diseased joint. At all events, Brodie, as long ago as the first appearance of his well-known work, was fully aware of the value of fixation of joints by splints to insure their quiet. He seems, too, to have used traction, but only to overcome deformity. But the earliest record with which I am acquainted of the use of traction definitely for the cure of joint troubles is in the *Medical Examiner* of January 19, 1839. Dr. Harris, of Philadelphia, there reports certain cases of hip-disease treated by Physick's splint, followed by paste-board splints, and another treated by Gibson's Hagedorn's splint. Later, Dr. Alden March, of Albany ("On Coxalgia, or Hip-Disease." Trans. Am. Med. Ass., 1853), developed the use of traction in hip-disease, basing his treatment partly upon certain pathological investigations, but mainly upon the clinical observation of the relief afforded by such traction. Then followed, within the next few years, a rapid elaboration of the idea and a substitution of traction by means of portable apparatus for traction made while the patient was in bed.

The only safe basis upon which a plan of treatment can rest is that of clinical experience. This particular plan was gaining strength through the facts ob-

* Read before the Surgical Section of the New York Academy of Medicine.

served as to the relief of pain, the diminution of deformity, and the probable abbreviation of the duration of the disease by its use, when it unfortunately became involved in a dispute with which it had no necessary connection: the dispute, namely, as to the etiology of this whole class of diseases. Whether this entanglement was the result of the coincident discussion of the two subjects, or whether it was due to the illogical zeal of those who believed that if the new treatment was right then the old theory of causation was wrong, I do not pretend to say. But at all events the controversy was regretable since it made what should have rested upon an experimental ground alone, contingent upon the settlement of an etiological and pathological question. Thus, a subject of great interest and importance was made a hindrance to the proper consideration by one yet more important.

It is in no way the object of this paper to attempt any discussion of the relative value of struma and traumatism as factors in the causation of joint diseases. But as an indication of the futility of endeavoring to attack or defend the mechanical plan of treatment upon any etiological theory, it may be worth while to quote some of the definitions of the word scrofula.

Mr. Savory, in the beginning of the article upon scrofula in "Holmes' Surgery" (Vol. I.), says:

"Scrofula is, in one respect at least, an unfortunate word, for it is not clearly defined. On the contrary, very different significations are attached to it. It has certainly become a vague term, so that wherever met with it is necessary to refer to the context to obtain an idea of the sense in which it is employed. For example, by some it is applied to a certain state of constitution, and by others to the disease which results from it. Again, it is often applied to all the diseases which, arising in a certain state of the constitution, possess some general features in common; while it is sometimes limited to the absolute deposit of tubercle, being simply synonymous with the more modern phrase tuberculosis. Finally, the confusion reaches its climax by the introduction of the adjective scrofulous, which is, and perhaps ought to be, if used at all, employed in the same sense as the substantive, but it is applied more frequently, at least in conversation, as a less definite term to doubtful cases, when the features are obscure and the diagnosis uncertain.

"It is necessary to state, then, that in these pages by the term scrofula is understood a certain disease or defect of the constitution in which there is a tendency to produce and deposit a substance called tubercle in various tissues and organs. Tubercle may therefore be said to be the essential element of scrofula." A little later tubercle is described so as to include both the miliary tubercle and the cheesy tubercle. Mr. Savory certainly does not exaggerate the confusion regarding the matter. Writers that were of the greatest authority when some of those present were students, Samuel Cooper and Abernethy, for instance, generally avoid a definition. Cooper, in his "First Lines," speaks simply of local manifestations; nor in his "Dictionary" does he venture upon a definition, but while describing the local expressions of the disorder, combats the idea that these are the primary disturbances, and holds to an antecedent cachexia. Mr. Abernethy ("Lectures") says in his peculiar abrupt and practical way:

"Now the glands are peculiarly liable to be disordered in a bad state of health, and we call it scrofula; that is, if the disordered state continue for a long time. To say that the absorbent glands are not subject to scrofula would be absurd. We know that they are; there is every symptom of scrofula; there is an indolent tumefaction, succeeded by a more active degree of inflammation, followed by a secretion of a curdy kind of matter, called scrofulous matter. I am very adverse to calling all intractable diseases cancerous, or all indolent diseases scrofulous. There are many indolent diseases of the absorbent glands that are not scrofulous," and more to the same effect. The matter was certainly not by him clothed with any unnecessary prolixity.

But of late years the attempt has been made to establish the real nature of scrofula, and most writers experience a difficulty similar to Mr. Savory's in framing a definition, although they agree in many points upon the essential peculiarities. One insists upon inveteracy and the tendency to cheesy degeneration—another upon the non-vascularity of the products, etc. One of the writers, Birch-Hirschfeld ("Ziemssen's Cyclopœdia"—Am. Trans., Vol. XVI., p. 761), after a preliminary discussion of about twenty pages, says:

"Having premised these general remarks, we may try to give a short definition of scrofulosis. Leaning on previous definitions, especially those furnished by Virchow and Billroth, we may designate scrofulosis as a constitutional anomaly which shows itself by changes partly of an inflammatory, partly of a hyperplastic nature, excited in the tissues by a comparatively slight noxious influence, changes which are endowed with insufficient recuperative power, and are therefore prone to lapse into regressive metamorphosis and, following thereupon, into local tuberculosis."

In the essentials of this definition, Rindfleisch, in his article upon tuberculosis in the same work (Vol. V.), concurs.

So Hueter ("Allgemeine Chirurgie," p. 731) recurs to the necessity of every writer defining what he means by scrofula. He adopts nearly the definition of Billroth and gives: "Scrofulosis is characterized by an increased inflammatory irritability of the body and by a tendency of existing inflammations to extension both as to space and to time." But with Hueter an assumed dilatation of the lymphatic vessels and a consequent ready ingress of monads plays an important rôle.

In making these quotations I have not sought to multiply them, but have taken simply those in works within reach from my writing-table. One more quotation shall be the last. It is from Flint's "Practice" in a brief article on scrofula. After giving a list of disorders "considered as local expressions of this diathesis, or, at least, as deriving from it important modifications," the author says: "That these affections involve a morbid constitutional state, either congenital or acquired, is undoubtedly true; but that they originate in a special cachexia is by no means certain. Even in children who have a scrofulous affection of the glands, the concurrence may be accidental. It is certain that the various affections just named are often observed in cases in which the glands are not affected; and *per contra*, the glands are often the seat of scrofula without the coexistence of any of the other so-called scrofulous affections."

These quotations have been adduced with no purpose to establish a theory of scrofula or of its effect in joint diseases, but simply to show that if the mechanical treatment of these diseases is to stand or fall with any such theory, we have yet to wait a long time for the decision.

Still further is it regretable that the question of treatment and the question of etiology should have thus become involved, since the fervor of controversy has driven many to take up positions which I suspect they do not soberly purpose to defend. Much of the acrimony of the discussion is doubtless due to mutual misapprehension. The issue is mainly one of terms. For, while one party claims that these peculiar inveterate joint diseases arise from struma, and the other party is equally sure that it must have arisen from an injury, the one means that whatever injury may have been received, such a white swelling cannot be developed without a previously existing scrofulous diathesis; and the other, that whatever the diathetic taint, the local disease is excited by an injury received at that point. In a very considerable proportion of cases the evidence of the existence of both the diathesis and the traumatism is conclusive. In other cases again, the history of struma is plain, and that of injury obscure; and on the other hand, cases may be traced to a distinct injury while but uncertain symptoms of a vulnerable diathesis exist. These cases are seized upon by the disputants, each emphasizing those that impress him, and ignoring those which are convincing to his antagonist. And yet he would be a bigoted diathesist who held that an injured joint was no more susceptible to inflammation than an uninjured one, and he would be a hardy traumatist indeed, who should deny the influence upon a synovitis of the constitutional condition of the patient.

But in detail the believer in struma enlarges his definition of that word and cross-examines the patient as to his personal and ancestral health with a minuteness that would lead the strongest and soundest to confess "there is no health in us:" and the traumatist carries his point so far that a hydrops articuli or a synovitis following—say scarlatina—is attributed to an assumed sprain received in turning in bed. The debate might be prolonged as indefinitely as that famous one in the colored debating society on the question, "Which is the mother of a chicken, the hen that laid the egg, or the hen that hatched it?" It would indeed not be of particular interest in this connection were it not for the tendency to forget that a disease may be at once scrofulous and traumatic, and that the exclusive adoption of one or of the other side of the controversy is likely to lead to the abuse or neglect of mechanical treatment.

The abuses that arise from belief in the exclusively diathetic origin of the disease, are the reliance solely upon antidiathetic treatment, and the neglect of several evident surgical needs. Thus pain is allowed in many cases to continue which could be relieved by the proper use of traction, and distortions are allowed gradually to occur, which likewise could have been prevented. These two claims of the mechanical treatment should insure its use, whatever views regarding the diathesis a practitioner may hold, unless he is prepared to show, or is at least convinced, that mechanical treatment delays recovery, or in some other way is sufficiently disadvantageous to offset its evident benefits.

On the other hand, the too eager traumatist may fall into the error of trusting as fully and exclusively to his apparatus as he would to his splints in the treatment of a fracture, and of utterly neglecting the constitutional condition of the patient. The psychical effect upon the patient or his friends (the ocular evidence, namely, that "something is being done") is such that there is often a tendency to construct apparatus for cases that would be quite as well without it. The commoner disadvantages, however, are: 1. The general practitioner, even if he be desirous of trying new plans, has ordinarily little knowledge of mechanical appliances, and little time to study or adapt them, and consequently relies mainly upon the instrument-maker, who is ignorant, at least, of the whole surgical aspect of the question.

2. When a machine has thus been provided, both attendant and patient are likely to trust to it as if it had some occult power, and are confident that "the best is being done," when real and serious neglect exist.

3. This neglect, combined with the extravagant expectations entertained by the patient, and perhaps encouraged by the attendant, pretty certainly leads to disappointment; and,

4. By a natural revulsion the whole plan of treatment is abandoned, and a fair amount of advantage that might have been obtained is thrown away.

It is always a thankless, often a hazardous task to endeavor to estimate the relative or actual value of contending theories. Yet, generally, as in this instance surely, the only safe ground is between the extremes. Both theories rest on facts; error comes in only when exclusive dogmas were built upon a part of the facts. Error always will come when the one safe plan of meeting as far as possible empirically all the indications is deserted. In regard to the diseases under consideration, this plan demands that a practitioner should be on the alert to detect any diathetic condition to be combated and, if possible, corrected. He will not be blind to syphilitic manifestations, nor to those of rheumatism or rickets. He should be as watchful for those of scrofula or any other form of cachexia. And according as he detects these, will he modify not only the constitutional treatment, but perhaps even the local surgical appliances. On the other hand, I must repeat, whatever the cachexy, he cannot be excused from seeking to relieve the local trouble by appropriate surgical dressings.

We gladly then pass to an attempt to estimate the general mechanical indications—in a wide sense—of the local treatment of diseases of joints, and in a general way to suggest some of the principles that should govern the choice of mechanism.

The local indication in all cases of the kind we are considering during the activity of the disease, is rest of the affected articulation. This fact is sufficiently well established by clinical experience and may be explained by reference to the physiological law that all use of a part of the body is attended with a flux of blood toward that part. Hence, motion of a joint brings blood to it, already hyperæmic from disease, and the inflammation must be increased thereby.

Now, in some cases of synovitis the joint seems to gain sufficient rest if the patient simply keeps the bed or, at most, has the limb supported in such a way as shall relieve it from motion, strain, or tension. These are cases which lead to doubt and dispute whether they are cases of simple synovitis, or whether they are essentially the same as those others that subsequently become synovitis fungosa or white swelling. And herein lies the chief objection to treatment, at least for any considerable time, by confinement to bed, that namely in cases where the constitution is such as to make the occurrence of fungous synovitis probable, the disadvantage in want of air and sunlight, and the disturbance of function due to confinement, will probably fully balance the good obtained by the rest. In cases of fair constitution, where simple rest is sufficient to meet the symptoms of the arthropathy the general condition may be kept up by the means of massage, not applied to the affected joint, but to the person in general. The circulation,

condition of the skin, and, as a consequence, the general nutrition, are thus improved.

Again, cases occur where although the patient, a child for example, is kept in bed, he is only nominally at rest. He is incessantly active, and the bed is only a more restricted field of operation. I can recall a case of hip-disease that was distinctly worse—though under active treatment and constant care—after Saturday holidays, because the other children played in the sick-room, and the invalid endeavored, to the best of his ability, to do his share of the romping. Eventually this little fellow was sent away from home, to gain a rest he could not otherwise obtain.

But if the inflammatory action be quite acute, an enforced rest of the joint beyond that obtained by simple recumbency will probably be necessary. This may be secured by the use of almost any kind of simple splint properly adapted to the contour of the joint and trunk or limbs above and below. The particular material selected is often a matter of indifference, although one may chance to suit an individual case better than another, or may better accord with the tastes of the attendant. Among the best are leather, and the starch, glue, or plaster-of-Paris bandages. They should all be so arranged as to admit of ready removal for the inspection of the joint, or for other purposes. This involved no real loss of fixation; for although the immovable dressing seems at first to be more secure, it very soon loses its exact conformity to the surface of the limb, and unless it be frequently changed, it speedily ceases to be of more value than a simple padded splint would be.

If, however, there be much muscular spasm, appliances of the sort described will rarely be sufficient. Indeed the advance of the disease to a point where the muscular spasms become a prominent sympton is often, I am sure, due to the real, though not evident, inefficiency of the retentive dressing. When the muscular spasm is urgent, fixation cannot be secured, save by the use of a force as constantly acting as that which is to be overcome, and the agent best adapted to this purpose is *traction* or, as it is generally called, *extension*. The word extension is objectionable because of its obscurity, since it is used as the opposite of flexion; and in the treatment of fractures the agent traction is called by the name of the object sought, namely, the *extension* of the broken bone to its normal length, and, probably as a result, the expression extension in this connection involves a false supposition which I shall mention later. Under traction I mean to include all methods of applying it, whether by simple weight and pulley, elastics, or by the various forms of portable apparatus that are applied to the person, and are so arranged as to make traction directly or indirectly upon the diseased articulation.

Traction may be used: 1st. As a means of relief when the disease is active and acute; 2d. To remove or correct deformities resulting from the disease after the latter as such has ceased; or, 3d. It may be used for both purposes during the activity of the disease, or to prevent anticipated distortion. The second use of traction is purely mechanical, like the application to the treatment of fractures, and its particular methods and modification must vary with the mechanical obstacles to be overcome. Now I am not aware that any one has ever claimed that traction in and of itself exerted any curative influence upon a synovitis or upon osteitis or caries of the joint-ends, although the excess to which the treatment has been carried by some injudicious practitioners would suggest that they acted upon a theory that the benefit could be calculated by a mathematical formula, and that it was directly proportional to the tractile force employed. Its most intelligent and ardent advocates employ and advise it simply because clinically it is the best method, all things considered, of securing true rest of a diseased articulation. In order that it should be so employed as to deserve this praise a number of things are to be considered, for traction misapplied certainly is of no use, and often is downright distressing, and in many ways harmful.

The crucial test as to the propriety of using traction is, does it or does it not give relief—I am now speaking of its use while the disease is in progress. If it does, it is certainly indicated, if not, it is of doubtful utility; if it occasions distress, it is certainly contraindicated. But before deciding that it does not give relief, we must answer at least the following questions:

1st. *Has the traction been long enough continued?*

In order that it may do any real good, the traction must be long continued, although the relief of pain may be immediate and continue as long as the traction is employed, yet as the disease is very inveterate and slow in changes, any plan of treatment that aims to be successful must be persisted in for a long time.

2d. *Is the amount of traction proper?*

It sometimes happens that the traction is insufficient and but partially overcomes the muscular spasm. In that case addition to it will give the desired relief. But it is quite as likely to happen that the traction is unnecessarily great. The relief gained is not, as was formerly imagined by some, from the separation of diseased surfaces. This separation is scarcely possible under any amount of force likely to be employed by a surgeon; and again, it is very probable that whatever separation could be accomplished has already resulted from the effusion within the joint. The relief is gained simply from the prevention of muscular contractions which violently grind together the inflamed and perhaps eroded surfaces. The aim of the surgeon should then be, not to use all the traction that can be tolerated, but to use the smallest amount that will ensure the rest of the articulation.

3d. *Is the traction made in the right direction?*

It should always be borne in mind that the position in which the limb, a joint of which is diseased, is found, is not the result of accident. In the first place the muscular spasms, resulting from the joint irritation, change the position of the joint from the normal one. But the irritation affects not a single set of muscles alone, but several, and their contraction varies according to the relative strength of the muscles and the degree of irritation. The limb cannot follow the dictates of each group, and the position assumed would express the resultant of their forces were it not that there is added a certain amount of instinctive or semi-voluntary muscular action, having for its object the diminution of or abolition of motion in the joint. The position of the joint then—excepting cases where adhesion exists, or where some muscles may have become contractured—represents the equilibrium of the muscles to prevent attrition. The position of fixation is probably not painless, and is not maintained without serious effort, but it is generally the attitude of minimum suffering. This position of equilibrium should not be rudely disturbed, for an attempt to suddenly change it causes a spasm of those muscles at the expense of which the change is effected, and this spasm will cause pain, possibly trivial but most probably agonizing. If in such a case then we desire to make traction, we should first see that the tractile force is applied in such a direction, or in such direc-

tions, as shall exactly supply the place of the muscular contractions, if they have been sufficient to keep the patient free from acute pain. Then, when the relief of the pain allows the muscles to relax, the direction of the traction may be gradually changed from that first assumed to that calculated to bring the limb into the desired position. To illustrate: A diseased hip with strong contraction of the flexors of the thigh will be rather irritated than relieved by traction (by weight and pulley) horizontally when no allowance is made for the angle of flexion. The insertions of the contracted muscles become a fulcrum, the traction will move the thigh in an angular direction, like a lever, and the effect will be to crowd the head of the femur into the acetabulum instead of preventing such crowding. So in a contracted knee, and generally.

In a similar way traction may defeat itself through the tension of muscles and become a real compression of the diseased joint: thus, when the synovial sac of the knee is much distended with liquid, traction from below the knee may act simply to compress the subpatellar enlargement beneath the rectus and the vasti, or in the same way to crowd eroded surfaces together. In such a case these muscles must be relaxed by position or by strapping them *toward* the joint.

4th. *Is the traction acting on the proper joint?*

Where, as is generally the case, the joint diseased is in a limb, any traction applied to the extremity of that limb will be distributed over the various joints. Some of them would be thus subjected to unnecessary or injurious traction. The method of applying the force should therefore be such that all joints between the point of application and the joint to be acted upon should be efficiently protected against the traction. The particular means of protection must vary with the kind of traction employed.

The length of this paper forbids my entering upon any discussion of the general principles of portable traction instruments. It may facilitate discussion, if I recapitulate the points I have endeavored to establish.

1st. The origin of the mechanical treatment of joint diseases was empirical.

2d. That the involving of the discussion of this plan of treatment with a question of etiology is unfortunate and unwarrantable, since the etiological dispute is largely one of terms, and is yet too far from settlement to be allowed to dictate what shall be the surgical treatment.

3d. That too eager espousal of the one or the other side of the controversy may lead to abuses.

4th. That in any event the merits of a local mechanical treatment are sufficient to demand its employment.

5th. After speaking of some simple means of retention, I have enumerated some of the essentials of the proper use of traction.

St. Luke's Hospital.—Dr. J. L. Little has been appointed Consulting Surgeon, and Dr. James R. Leaming, Special Consulting Physician for diseases of the heart and lungs.

Medical Society of the District of Columbia.—This Society celebrated its sixtieth anniversary December 20, 1877. Addresses were delivered by Drs. J. M. Toner and A. Y. P. Garnett.

Dr. Anton Fleischer, Professor of Chemistry in the University of Klausenburg, committed suicide recently. He was driven to the fatal act by the unbearable suffering caused by an incurable disease.

BELLEVUE HOSPITAL.

Notes of Practice and Peculiarities of Treatment.

QUININE IN THE TREATMENT OF INTERCOSTAL NEURALGIA—DIAGNOSIS BY EXCLUSION AND BY DIRECT EVIDENCE.

A female patient complained of pain in the chest. It had continued four weeks, and at times had been rather severe—sufficiently so to interfere with the act of respiration. The pain, as it commonly is in this disease, was in the left side, and the patient was somewhat anæmic. Diagnosis of intercostal neuralgia was reached *first*, by exclusion; and *second*, by direct evidence, consisting of points of tenderness in the course of intercostal nerves. These points of tenderness on pressure were three: 1, in the intercostal spaces near the sternum; 2, in the infra-axillary and axillary regions; and 3, close to the spinous processes. The explanation of the tenderness at these points is that in these three situations the intercostal nerves send out cutaneous branches. The treatment recommended in this case was to develop slight cinchonism and maintain it for *two weeks*. It was regarded necessary to thus prolong the cinchonism in order to determine whether quinine was to prove efficacious in the treatment of any of these cases. Many cases did not yield until nearly at the end of two weeks, but if slight cinchonism was kept up for that length of time and the neuralgia was not benefited, it was quite evident that some other measure would be required.

SUPPOSED CASE OF PROGRESSIVE PERNICIOUS ANÆMIA—CANCER OF THE STOMACH—INTERESTING CASE FROM TWO POINTS OF VIEW.

A male patient, who dated his sickness from the summer of 1876, was admitted to the hospital in July, 1877. Physical examination, at the time of admission and subsequently, was negative with reference to all his internal organs. His peculiar pale countenance suggested examination of the blood, when it was found that there was evident diminution of the normal proportion of red globules, but the white globules were apparently undisturbed; there was no pigment in the blood. There was loss of digestion; the patient vomited his food occasionally, and occasionally suffered from diarrhœa. The anæmia had been progressive for a year or more when admitted to the hospital, and yet no satisfactory explanation of the condition could be found. There was no tumor, or pain, or vomiting of blood, or other symptom which suggested the existence of cancer of the stomach, and yet at autopsy cancer of that organ was found.

The case was interesting from two points of view: 1. As bearing upon the existence of the disease which has received the name of progressive pernicious anæmia; and 2, as illustrating the sparcity of symptoms which may attend the development and progress of cancer of the stomach.

CARDIAC DILATATION—RAPID DEVELOPMENT OF SERIOUS CARDIAC SYMPTOMS FROM APPARENT HEALTH.

A middle-aged man dated the beginning of his present condition at three months ago, when, after what he regarded as a trifling exposure at Creedmoor, he was seized with a chill, which was followed by a fever and pain in the left side. He was never sick

previous to that date. His sickness at that time kept him in bed for a few weeks, and he then was able to get about some, but unable to perform any labor which called for much physical exertion. During his sickness he had some cough and expectoration, and occasionally spat up *small masses of dark-colored blood.* He had lost about fifty pounds of flesh. He was unable to walk very much without getting tired, and was unable to go upstairs without sitting or lying down several times to get relief from the shortness of breath. During his acute sickness there was simple swelling of the feet without redness or pain. He was a marksman, and previous to the date assigned as the beginning of his sickness had been able to hold his rifle with perfect steadiness; that is, it received no noticeable motion from the body. He had been in the habit of drinking lager-beer for many years.

Physical examination revealed the existence of an increased area of cardiac impulse, epigastric pulsation, pulsation in the carotid, very indistinct apex beat, and situated to the left of the nipple. The case was regarded as one of probable dilatation of both sides of the heart, but especially of the left ventricle, and without compensating hypertrophy.

TENDERNESS UPON PRESSURE ON DIFFERENT PARTS OF THE STERNUM AS A SYMPTOM OF CONSTITUTIONAL SYPHILIS.

The case was one in which the presence of syphilis was suspected, and yet no history of the primary lesion could be obtained, nor could the evidence of secondary manifestations be made clear. Tenderness upon pressure over different parts of the sternum, especially the epigastric portion, was regarded as exceedingly strong evidence in favor of the presence of constitutional syphilis, for it was said there is nothing except that disease which produces such tenderness.

DOUBLE PNEUMONIA—A CASE SPECIALLY INTERESTING WITH REFERENCE TO TREATMENT.

A male patient, æt. 50 years, while in a state of partial intoxication, fell into the river, where he remained five or six minutes before being rescued. When brought into the hospital he was intensely cold. He was admitted at 2 A.M. on the 11th of the month. Although not actively delirious, his mind was wandering, there was slight fever, the pulse was 105, and his urine normal.

Soon after, his temperature was found to be 103½° F., and grs. xv. of quinia (sulphate) were administered. Evidence of pneumonia in both lungs was present.

Dec. 12th.—Temperature in the morning, 104°; in the evening, 102° F. Pulse, 120. Respiration, 28 in the morning; and at 3 P.M., P. 132 and R., 32. Patient delirious, tongue white and moist; pupils contracted. On account of the high temperature, the quinine was increased to thirty-grain doses, and ʒ ss. doses of whiskey were given every three hours. To-day symptoms of pulmonary œdema developed, and immediately dry cups were applied, and also wet cups, the latter removing ʒ x. of blood. One hundred dry cups were applied within a few hours. The patient also received twenty drops of tr. digitalis and half an ounce of whiskey hypodermically. These measures of treatment cleared up the symptoms of œdema of the lungs. Evidence of œdema of the lungs returned, and dry cups were again applied. In the progress of the case over 200 dry cups were employed, and ʒ x. of blood were removed by wet cups. Besides, whiskey, digitalis, carbonate of ammonia, were freely administered hypodermically and otherwise, and a liberal supply of nutritious food was given.

On the 13th there was marked improvement in all the symptoms, both local and general.

REDUCTION OF TEMPERATURE BY MEANS OF THE SPONGE-BATH — INTERESTING CASE WITH REFERENCE TO DIAGNOSIS AND TREATMENT.

A female patient had a fever, yet no local cause could be found to account for it, and it lacked the characteristics of any of the essential fevers. It was wanting in many of the characteristics of typhoid fever. There was no diarrhœa, no tympanitis, no eruption, and only slight sensitiveness upon pressure in the right iliac region. There was neither delirium nor appearance of stupor. If the case was not one of typhoid fever, what was it? It was believed by the visiting physician to be probably true that there are fevers which are really fevers of different species, but which at present are necessarily classed under the head of typhoid fever.

There was considerable rise in temperature, and yet the skin was quite cool, and the pulse scarcely accelerated.

With reference to the elevation of temperature and the means employed for its reduction, the following note was made.

On the fifteenth day of the fever, the patient was placed under treatment by means of the sponge-bath, and the house-physician, Dr. Chadwick, proceeded in the following manner. The patient's clothing was removed entirely; then with *tepid* water the whole of the anterior surface of the body was sponged, the patient was then turned upon the face and the entire posterior surface of the body sponged in the same manner; the sponging was continued *fifteen* minutes each time.

Dec. 7th, 3.30 P.M.—Temperature, 103½° F. The sponge-bath was used, and at 3.55 the temperature was 101½° F.

At 5.30 P.M. the temperature had reached 104° F. The bath was repeated, and at 5.55 the temperature was 103° F.

At 6.30, without another bath, the temperature was 102° F.; at 7.30, 101½°; at 9, 101°, and at 12 P.M., 101° F.

The effect of the bath apparently continued for some time.

Dec. 8th. 3 A.M.; temperature 103°, sponge-bath, and at the end of twenty-five minutes the temperature was reduced to 101½° F. At 7 A.M. the temperature was 98°, from which point it arose until at 3 P.M. it had reached 103° F. The sponge-bath was then used, and at 4 P.M. the temperature was 103½° F. The bath was renewed, and at 4.30 P.M. the temperature was 102°; at 5 P.M. 102½°; at 6 P.M. 102¼°; at 10 P.M., 102½° F.

Dec. 9th, at 2 A.M. the temperature was 103½° F.; the sponge-bath was used, and at 2.30 A.M., the temperature was 102° F. At 7 A.M., the temperature was 102½°; at 8, 102¾°; at 9, 102½°; respiration 30, and pulse 80. At 10 A.M., the temperature was 101°; at 12 M. 104° F. The bath was then repeated, and the temperature fell to 101½° F.

At 1 P.M., the temperature was 101½°; at 4 P.M., 101½°; and at 6 P.M., 102¼°.

Dec 10th; at 1 A.M., the temperature was 102°; and at 11 A.M., 101¼° F. At 2 P.M., the temperature was 103½°. The bath was resorted to, and the temperature soon after was found to be 104° F. The bath was repeated, and at 3 P.M. the temperature was 103½° F; at 4 P.M., 102°; and at 5 P.M., 103° F. The bath was

repeated and the temperature soon fell to 101° F. At 12 P.M., the temperature was 100½° F.

Dec. 12th; at 2 A.M., the temperature was 100½°; at 8 A.M., 100½°; at 10 A.M., 100½°; and at 6 P.M., 103° F.; pulse 80, and respiration 20. The bath was again employed. At 10 P.M., the temperature was 102° F., and at 12 P.M., 101° F.

At the time this note was made, Dec. 13th, 10 A.M., the temperature was 100° F., and the outlook of the case was good.

THE RELATION OF CARDIAC ENLARGEMENT TO EFFECTS PRODUCED UPON RESPIRATION IN CHRONIC HEART DISEASE—ILLUSTRATIVE CASES.

Two cases of chronic heart disease were seen which were interesting by way of contrast. In both cases there was physical evidence of valvular lesion; both patients had a musical, aortic, regurgitant murmur. There were no other valvular lesions in either case. One patient, however, suffered in a marked degree from shortness of breath on slight physical exertion, and in his case there was an increased area of cardiac dulness.

The other patient had little or no enlargement of the heart, and did not suffer specially from symptoms referable to the chest. The man was anæmic, but he did not suffer from labored respiration. The cases illustrated the fact that it is the enlargement of the heart, coincident with valvular lesion, that stands in direct relation to symptoms of cardiac disease, especially with reference to the effect produced upon respiration.

Progress of Medical Science.

DILATATION OF THE URETHRA BY THE URINE ITSELF.—Towards the end of the last century Brunninghausen recommended this method of dilatation, which he claimed to be more easy and simple than that by bougies. To practise it the patient must simply compress lightly the urethra behind the glans with his fingers whenever he wishes to urinate. The pressure must be such that the urine can only escape slowly and after having remained some time in the canal; as a necessary result the canal will be more or less dilated through its entire length, in the constricted as well as in the healthy portion. If this be repeated every time the urine is voided, the same effects will gradually be produced as if bougies had been used, while at the same time the inconveniences of the latter are avoided. M. Bérenger-Férand has employed this method in his practice, and the following are the conclusions he has arrived at with regard to it:

1. Dilatation of the urethra by the urine, repeated at each urination for a long time after a prolonged attack of gonorrhœa, seems to prevent the formation of strictures.

2. In cases of moderate strictures it seems to have restored the normal calibre of the canal, or at least to have restored the calibre sufficiently to render micturition easy.

3. After the operation of urethrotomy it will perhaps prove useful to prevent, or at least to retard notably, the return of the constriction.

4. In cases of varicose dilatations at the neck of the bladder, or in the membranous portion of the urethra, it appears calculated to be serviceable.

5. It seems to prove useful also in the cases of partial or total hypertrophy of the prostate in old men. In such patients the first drops of urine, which are emitted with so much difficulty and slowness, will serve effectually to fill the canal if the meatus be kept closed. When the ordinary calibre of the canal is once re-established in this way, the remaining contents of the bladder can be evacuated easily. The method has this great advantage, that it does away with the difficulty of emission after the first drops have escaped from the bladder; when it is not employed, the difficulty of emission persists during the entire act: the micturition, moreover, becomes intermittent, and the bladder is incompletely emptied, as a result of which, frequent desire to urinate is soon experienced.—*Lyon Médical*, October 7, 1877.

IS CASEOUS PNEUMONIA TUBERCULOUS? — Prof Charcot insists that the fundamental and exclusive basis of all caseous masses, large or small, in the lungs is tubercle. The ordinary microscopic gray granulation consists of an aggregation of elementary tubercles, each of which consists of a central giant-cell, surrounded by a zone of embryonic cellules that are readily colored by reagents. When degeneration sets in, the central giant-cell is the first to undergo the caseous transformation; it is no longer tinged by carmine. In agglomerate masses of tubercle, the central follicles are the first to become caseous. In caseous pneumonia, the diseased mass is really made up of tubercles, but they are lost sight of in consequence of their enormous numbers. When a section from a small caseous nodule is examined under the microscope with a low power, the lobular bronchus and arteriole are found imbedded in caseous islets. Otherwise, with this power, the pulmonary tissue appears healthy. When higher powers are used, the central bronchus and arteriole are seen to be more or less obliterated, and their walls to be more or less altered. They are surrounded by a yellowish, uniform mass, which does not color with carmine. In this mass caustic soda reveals elastic fibres, which outline the alveoli. The zone around it colors red, and is composed of embryonic cells. Here and there at the periphery of this zone are giant-cells arranged like detached forts. Each of these giant-cells is surrounded by a small embryonic zonule; it seems to be the centre of formation of an elementary follicle, just as it would be a centre of crystallization in mineralogy. In a word, each islet is merely an agglomeration of elementary tubercles, which increases peripherally by the formation and annexation of elementary follicles, each with its central giant-cell. The larger caseous masses, whether they be as large as a nut or fill an entire lobe, are formed in the same way; the zone of embryonic cells and giant-cells will always be found at the periphery.

A careful examination of the pulmonary parenchyma around the nodules will, according to Charcot, demonstrate still more conclusively the error of Virchow and his followers, in regarding caseous pneumonia as simply a degenerated pneumonia. The neighboring alveoli are filled with proliferated epithelium, or with fibrinous, purulent, or mucous exudations; these pathological products, however, never undergo real caseous degeneration. Here, as elsewhere, the epithelial cells become granular and fatty, and form granular bodies, etc.

Prof. Charcot consequently believes that we must return to the theory of Laënnec; caseous or pneumonic phthisis is by nature tubercular. It is constituted by agglomerations, often very voluminous, of tubercles.—*La Tribune Médicale*, Sept. 23, 1877.

PHYSIOLOGICAL ACTION OF PAO-PEREIRA (*geissospermum laeve, Baillon*).—The following is a *resumé* of a

communication made to the *Académie des Sciences* by MM. Bochefontaine and de Freitas, on the physiological action of the pao-pereira. In their experiments they employed the infusion and the alcoholic extract of the powdered bark, and also geissospermine (pereirine) dissolved in water or alcohol. The effects were studied on frogs, Guinea-pigs, and dogs, the drug being administered by hypodermic injection.

1. Geissospermine has no, or at least only a very feeble, local irritating action, and hence is suitable for hypodermic use.

2. It is a toxic substance. Two milligrammes (gr. $\frac{1}{31}$) prove fatal to a frog, when introduced under its skin; one-half milligramme (gr. $\frac{1}{135}$) is enough to cause paralysis. Administered in the same way, one centigramme (gr. $\frac{1}{6}$) proves fatal to an adult Guinea-pig. Two grains are sufficient to paralyze a small dog so as to render all spontaneous movements impossible.

3. In many of the experiments, geissospermine diminished the frequency of the heart-beats. This fact has also been noticed clinically. The arterial pressure in the carotids was notably diminished.

4. The respiratory movements become less frequent.

5. The voluntary movements cease before the reflex movements. The drug consequently seems to act on the brain.

6. Finally, the reflex movements are gradually abolished. The drug, consequently, acts on the spinal cord and the medulla. In a frog from which the brain had been removed, but in which the cord still retained its reflex power, this power was abolished by geissospermine.

7. The sensitive nerves appear to preserve their functions as long as the motor nerves. When the main artery of one hind leg of a frog is ligated, and the geissospermine is injected into one of the front legs of the animal, the limb whose nutrient artery has been tied is not affected by the poison. Nevertheless the reflex movements excited by irritation of the sensitive nerves are exactly the same in both hind legs. The excitability of the nerves is not lost until the animal has been torpid and inert for a considerable time.

8. Muscular contractility is not affected by the poison, for it persists even after the death of the animal.

To conclude, the active principle of geissospermum læve is a paralyzing poison, which abolishes the physiological functions of the central, gray, nervous substance, and particularly of the gray substance of the spinal cord.—*Le Mouvement Médical*, Sept. 15, 1877.

Diapedesis of Leucocytes in Man.—In a short but very interesting memoir, Prof. Collin, of Val de Grace, gives the results of his studies on the migration of leucocytes in man. He shows that clinical observation and pathological anatomy confirm the researches of experimental physiology. It has long been known that when a fine, colored powder, carmine for instance, is injected into the vascular system of an animal, the leucocytes seize on the small red granules, envelop them with their protoplasm, and carry them along through the blood-vessels. They can readily be followed through the circulation, and it is easy to demonstrate their passage through the vascular walls, and their extravasation into the surrounding cellular tissue. In malarial poisoning and the melanæmia which results from it, pigmented depots are found in different tissues, particularly in those which are in most intimate contact with the blood, such as the vascular walls. These depots are derived originally from the red blood-corpuscles, which are destroyed in the spleen. The white blood-corpuscles, as has been proved by microscopical examination, take up the débris of the red globules, and escaping from the blood-current, form with it the pigmented collections in the vascular walls and in the different tissues. According to M. Collin, this migration of globules filled with pigmentary corpuscles is very active. In countries where malaria is rife, the yellowish, earthy tint which is due to general pigmentation of the tissues, and consecutive to a diapedesis of white globules filled with pigmented granules, sometimes appears after only two or three attacks of fever. —*Le Progrès Médical*, Sept. 22, 1877.

The Ætiology of Diphtheria.—Dr. Thorne has observed and reported an extensive epidemic of diphtheria occurring at Great Coggeshall, in Essex. The outbreak commenced in November, 1875, and continued till the end of 1876. The disease was at first not recognized, the first seven deaths being registered as due to "croup." Dr. Thorne, however, satisfied himself that these early cases were diphtheria, showing amongst other things that the disease was from the start of an infectious character. No antecedent case could be heard of, and both Great Coggeshall and the surrounding district had been for some time remarkably free from those diseases liable to affect the throat, thus having more or less affinity with diphtheria. There were no diseases among the cows that might affect the milk supply, nor were there any known sanitary defects common to the houses first attacked. Dr. Thorne confidently expresses the opinion that the first case or cases had not been arrived at. Strong evidence is brought to show the infectious nature of the disease; in one series of cases the infection is traced through fifteen persons, starting from two children who were attending school. The whole place is remarkable for the dampness of its site. The effect of temperature and rainfall on the spread of the disease was very marked, and from the tables Dr. Thorne has prepared it is seen that the largest number of attacks occurred during the months of excessive rainfall and comparatively low temperature, whereas, with a rising thermometer and a diminished rainfall, the number of attacks became smaller. Owing to the bad sanitary arrangements throughout the entire place, observations on this point were unsatisfactory, but it was noticeable, nevertheless, that a very large proportion of the cases occurred in overcrowded and ill-ventilated houses. In two instances second attacks occurred, and in each the second attack was far worse than the first. In one of them the last attack was fatal.—*The Practitioner*, November.

Adulteration of Butter with Fat.—Butter is frequently adulterated with other animal fats, such as suet, lard, margarine, etc. It is often difficult to discover this adulteration, because the chemical and physical properties of the doctored article differ very little from those of pure butter. Dr. Jaillard, of Algiers, employs microscopical examination in his analysis of butter, and finds it more reliable as well as more simple than the chemical examination. Pure butter appears under the microscope as round globules, varying in dimensions, while the other animal fats appear under the form of needle-like or branched crystals. When the butter has been adulterated with fats, these crystals will be found in more or less abundance.—*Journal de Méd., etc.*, August, 1877.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, January 1

THE PECUNIARY VALUE OF EXPERT TESTIMONY.

A DECISION has recently been rendered, before the Superior Court of Indiana, which is of the greatest interest to the medical profession not only of that State, but of the whole country. The question which was sought to be settled was, whether or no a physician has a right to receive compensation for testimony as an expert in a court of law. Until the case to which we shall refer was brought up for serious adjudication no one had any doubts on the subject, and that such doubts have been created will be as much a surprise to the majority of the profession as were the arguments upon which they were based.

On the 16th day of November, 1877, Dr. Thomas J. Dills, a practising physician of Fort Wayne, Indiana, was summoned by subpœna to testify as an expert in the case of the State against Robert Hamilton for Rape. After answering the usual questions as to qualifications, he was asked the following by counsel for the defense: "State whether or not, in cases of female menstruation and towards the end of the period, there is sometimes a retention of a portion of the menses." This the witness refused to answer, upon the ground that it called for his professional opinion as a matter of right and without compensation. He thereupon filed his objections and appealed to the court in behalf of the justice and equity of his claim. After due deliberation, Judge Borden ruled against the petition, and on further refusal he adjudged the witness in contempt and ordered his commitment to the county jail as a punishment therefor. A writ of *habeas corpus* was sued out before Judge Lowry, who, after a long and patient research in English common law, statutory enactments, etc., decided against the suit and remanded the witness to the custody of the sheriff. After this decision the witness returned to the stand, purged himself of contempt, but offered his testimony under protest, thus reserving all his individual and professional rights before the law.

The case was in many respects a novel one, and, as we shall see by reference to the opinion of his Honor, Judge Lowry, was the occasion of some curious exceptions. The question to be decided by Judge Lowry was, as stated in his own words, briefly this:

"Has a person called as an expert—in this case a physician—having in all other respects as to attendance as a witness, at the instance of the defendant, and answering all preliminary questions in a trial in the criminal court for felony, when called upon for his opinion upon a question of skill pertaining to his profession, a right to refuse to answer until provision is made for his compensation, either by the defendant or the court; or is he in such case guilty of contempt and subject to imprisonment?"

In regard to the matter of special compensation, it is contended by his Honor that no provision therefor has been made in common law, and that even in criminal prosecutions there has been no distinction between witnesses testifying as to facts and those called as to questions of skill. So far, then, as the common law is concerned, the question would seem on general principles to be settled.

Examining into the subject still further, his Honor bolsters up his argument against extra compensation by a reference to statutory enactment. There is a constitutional provision in the laws of Indiana providing that

"* No man's particular services shall be demanded without just compensation. No man's property shall be taken by law without just compensation; nor, except in case of the state, without such compensation first assessed and tendered."

While the fact of the existence of this law is of course admitted, its applicability is denied; that is to say, it is claimed that a man's opinion is not his special and individual property, and is therefore not comprehended in the term "particular services."

The manner in which this proposition is attempted to be proved by the judge is so ingenious, and carries with it so much of the air of subtlety, that we make from his charge the following quotation in point:

"When a witness is required simply to testify in a court of justice, it cannot be said in the sense of this provision that his property is to be taken. He is not to be deprived or divested of anything. If he have an opinion on the question in hand, it is not proposed to dislodge it or dispossess him of it and transfer it to the enjoyment and dominion of some one else. It is proposed simply that he shall give it expression. To do this it is necessary to set in motion the organs of speech. By their use he lays before the jury a statement of the laws appertaining to some department of nature, science, art, life or business not within the common and general observation and knowledge of mankind. This knowledge he has at some previous time acquired through the use of his senses, by the impressions made upon them from without, and by classifying, arranging, and comparing those impressions he has formed conclusions or opinions. He is now required to state what those opinions are; or it

* The Bill of Rights, Art. 1, Sec. 21, Const. Ind.

may be he is simply to state what the views of others of acknowledged authority are as received and acknowledged by his profession, as he may have got those views from books or heard them from the platform. This is obviously, in either case, a 'service' that he is required to render. It is not even some original combination of forces, or some new and grand invention of his own, that he is required to divulge. It is not an hereditament, corporeal or incorporeal—nor an easement connected therewith—nor a corporeal or incorporeal chattel."

Another reason for considering the services in the case in question of no pecuniary value is that they were to be rendered in a criminal case. (Israel *vs.* State, 8 Ind.) On this point the Judge remarks:

"We do not propose to go into a discussion with a view to a definition of 'particular services;' but we are prepared to say that the services of witnesses in criminal cases are not particular, but are of the class of general services which every man in the community is bound to render for the general as well as his own individual good. It is as much the duty and interest of every citizen to aid in prosecuting crime as it is to aid in subduing any domestic or foreign enemy; and it is equally the interest and duty of every citizen to aid in furnishing to all, high and low, rich and poor, every facility for a fair and impartial trial, when accused, for none is exempt from liability to accusation and trial."

Again, another reason which he offers why professional opinions in court should not be considered of extraordinary value, is simply that "persons in every pursuit in life are subject to be called as experts, to speak in court on questions appertaining to the particular domain of life in which they are engaged."

In further support of this particular view, his Honor quotes what he considers to be a case in point (Gaston *vs.* Board of Commissioners Marion Co., 8 Ind., 407). In that instance Dr. Gaston was directed by the coroner to make a post-mortem examination to determine the cause of death. He complied, and filed a claim accordingly. In that case the Court ruled in effect that "in a case where a post-mortem was really necessary, the coroner, by his employment, might bind the county to the payment for a sufficiency of professional skill to make the examination." What is considered to be the strong point here is that the Court did not allow extra fees for mileage and for attendance as a witness.

Having thus sketched as briefly as possible the charge of Judge Lowry, and presented the purely professional aspects of the question, we are prepared to discuss them in the order of their presentation. The first point which invites our attention is whether the opinion of a professional man is his property, and can be demanded as such by law, without compensation.

It must be acknowledged that a man's opinion is peculiarly his own. In the proportion as such an opinion is the result of an outlay of time, money, and labor, it becomes more or less valuable. It represents an entity of investment which is acknowledged by every one and rated accordingly. It is as much property, in the ordinary acceptation of the term, as any substance the existence of which is recognized by legal title. It is so much stock in mental trade, for which the world is willing to pay.

Judge Morris, the counsel for Dr. Dills, makes a strong point in this connection by quoting in his argument the decision in the case of Webb vs. Baird (6 Ind., 13), and applying it to his client's profession: "To the attorney his profession is his means of livelihood. His legal knowledge is his capital stock. His professional services are no more at the mercy of the public as to remuneration than are the goods of the merchant, the crops of the farmer, or the wares of the mechanic."

We fail to see how any professional opinion is proved not to be property because the party delivering it is not apparently impoverished. If we view an opinion as an entity its bestowal upon another, and for his uses, implies, as far as that particular case is concerned, a direct and unconditional surrender. It is then as much the property of the person receiving it as it was formerly of the person who gave it. As the party giving an opinion yields up an exclusive right to it, he is made the poorer in proportion to the many whom he has benefited by its expression. The giving expression to an opinion implies to the party receiving it all the benefits of actual possession. If an opinon is of any value to the party receiving it, the one who gives must be somewhat of a loser, else we are forced to the acknowledgment that something can come out of nothing, or what is the same thing, that a part can be taken from a whole without the latter suffering any change. Of what possible value are professional opinions if they are not worth paying for?

His Honor does not consider that it is any labor to give an opinion; all that it is necessary to do being "to set in motion the organs of speech." The Court would seem to draw a distinction between the expression of an opinion and the opinion itself.

His opinion on this question would seem to be a striking illustration of this theory, in that its expression is its most remarkable feature, and proves how much may be said by merely putting "in motion the organs of speech." If his Honor's theory be true, why could not any fool give it equal force and expression by merely setting "in motion his organs of speech?"

That professional opinions should not be paid for simply because the trial was a criminal one, is the poorest possible objection. When a medical man is a mere witness to facts, he is bound with every other citizen to testify to all he knows in regard to them. In this respect all men, professional or non-professional, are equal. When, however, professional opinions are asked, the testimony becomes of a particular character, of more than ordinary value, and should be recompensed accordingly. These particular opinions are really more valuable to the community in the trial of criminal cases than in any other. According

to the new doctrine, however, this is perhaps the very best reason why the State should simply demand and not pay for them.

Not only this, but the physician, while bearing the burden of an ordinary witness, has that of an extraordinary witness forced upon him as well. His capital and stock in trade, his education, his individual experience, and the time which belongs to the practice of his profession, whereby he makes his daily bread, are all placed under contribution by the State, simply because all that it is necessary for him in giving a professional opinion is to "set his organs of speech in motion." In either case he must answer all and every question without reserve. As an ordinary witness, this is his duty; as an expert, this is his misfortune. To be equal with all other citizens, he has no business to have more than ordinary knowledge of matters and things.

In order to further prove that expert testimony should not receive any extra pay, his Honor states that all professional men are alike, as each and all are liable to be called upon for special and expert opinions.

We grant this so far as giving testimony is concerned, but it is by no means plain why any court should command these services without recompense. There is a strange lack of relation between services and pay which can hardly be explained merely on the ground that such services are professional. This is probably one way of interpreting the principle of law which provides against any extra tax upon a particular class, by allowing imposition upon as many classes as possible.

In the case of Gaston *vs.* Board of Commissioners, which is apparently relied on by his Honor to prove that medical witnesses as such are not entitled to extra fee, there is a direct contradiction to his view. Here a post-mortem was considered necessary, and a pecuniary equivalent allowed. Everything relating to that autopsy was paid for with a view that it should furnish aid in the trial. The professional opinion upon that case, founded upon said autopsy, was as valuable as for any other expert service, and the mere fact that the witness did not get extra mileage and extra fees for expressing said opinion has nothing to do with the main issue.

There are many other points which are of a technical character, but which, having no direct professional bearing upon the case, we pass by. The case has, however, been appealed in a masterly argument by counsel for the witness. As we before remarked, the ruling in this instance, until it be set aside, is, in the light of a precedent, a dangerous and unjust one to the profession, and the appellant deserves the thanks of his brethren for the course he has pursued in making his case a test one.

We are informed both by Court and counsel that the plea is a novel one, that in fact no question like the one under consideration was ever brought up for settlement. In reading, however, a very able address on the "Medical Witness," delivered before the Indiana State Society by Dr. Wilson Hobbs, of Knightstown, Indiana (Trans. Ind. State Med. Soc., 1877), we find a reference to a letter from the distinguished Medico-Jurist, Dr. John Ordronaux, and in answer to a question upon this very point Dr. Ordronaux calls attention to the case of the People *vs.* Montgomery (13 Abbott Pract. Rep., N. S., p. 207), where the Court said:—"A witness meets the requirements of a subpœna if he answers in court when required to testify and gives proper impromptu answers to such questions as are then put to him. He cannot be required, by virtue of the subpœna, to examine the case, to use his skill and knowledge to form an opinion, nor to attend, hear, and consider testimony given, so as to be qualified to give a deliberate opinion in a question of science arising upon such testimony." Even previous to this ruling, however, it has been and still is the custom to pay for expert testimony when such compensation is demanded before the examination-in-chief.

THE NEXT MEETING OF THE STATE SOCIETY.

THE next meeting of the Medical Society of the State of New York will be held January 15, 1878, at Albany. As will be recollected, the time of holding the meeting was changed last year from June to the date named. We are constantly reminded of the necessity of giving regular notices of the meetings; otherwise, in consequence of the frequent changes of time which have been made of late, there might be a possibility that many of the members might become confused and lose an opportunity for attendance. The time set for the present meeting is illegal unless some special legislation is obtained beforehand to make it otherwise. We presume, however, that this will be attended to in time to prevent the Society from stultifying itself by the motion made last year. Let us hope if, for no other reason than that the Society should have a regular time to meet, that no further change will be made. We have no doubt that under the able presidency of Dr. Foster Jenkins, of Yonkers, the Session will be a very enjoyable and profitable one. There does not seem to be any doubt that the programme will be well filled, and that the usual number of valuable and interesting papers will be presented.

Dr. Squibb last year inaugurated a plan of soliciting papers, which on the whole was a very good one. It certainly secured an abundance of scientific material. In fact, if anything there were too many papers crowded into the allotted time, and there was too little opportunity for discussion. This was a trouble which might have been anticipated by referring all papers thus obtained to a proper committee. Far from the latter being the case last year, the Business Committee had but little more to do than to read the order of exercises. Doubtless Dr. Jenkins has provided for all these contingencies, and will in so far profit by the misadventures of his predecessor.

For the first time the new rule for the selection of the Nominating Committee will come into play. Heretofore the members of this committee were named by the President, now they are to be selected by the members of each district. It is difficult to see how any improvement could be made upon such an arrangement, or how its representative character could be more effectually secured.

THE LYING-IN HOSPITAL AT WASHINGTON AGAIN.

A WASHINGTON correspondent, and an Assistant Surgeon in the army, takes exception to our recent strictures upon the management of the Columbia Hospital for Women and Lying-in Asylum, and transmits the report of the institution for the fiscal year ending June 30, 1877, by way of furnishing the materials for correcting certain statements. As the statements were not only based upon, but explicitly credited to an article republished in pamphlet form from the November number of the *Louisville Medical Journal*, no original investigations of ours being either implied or pretended, it is a little singular that our correspondent omits to furnish the materials upon which a specific denial of the strictures can be predicated; particularly as we have no partisan bias to subserve in such strictures, and would be delighted to make the *amends honorable* most fully, were sufficient reasons assigned for doing so. For example, in looking over the schedule of annual appropriations submitted by the treasurer, it appears that for the six years ending June 30, 1877, they have amounted to $203,100. Add to this amount the appropriations for 1866 to 1871, inclusive, in all $73,000, and the sums appropriated to the hospital since its foundation foot up to the enormous aggregate of $276,100—almost $50,000 in excess of the aggregate stated upon the authority of the pamphlet. It is very true that the schedule of the treasurer accounts in full for the appropriations; but this is altogether beside the question whether extravagant expenditures have or have not been one of the features of the management under Dr. J. Harry Thompson, of whom our correspondent frankly confesses that he knows nothing. Eight thousand dollars for a mansard roof is, for illustration, a rather extravagant amount for such an improvement. Again, while the number of pay-patients and the amounts received for the last two fiscal years are stated in the report of the treasurer, their number under the administration of Dr. Thompson is not stated, and this is just the point at issue. Neither the present surgeon, Dr. P. J. Murphy, nor the administration of the hospital since he was appointed resident physician, was called in question in the article to which exception is taken; and as the report transmitted by our correspondent makes no answer whatever as respects the receipts from pay-patients from 1866 to 1875 inclusive, although the appropriations from 1872 to date form a part of the document, it is difficult to understand upon what data the allegation that such moneys have not been accounted for during Dr. Thompson's administration is to be authoritatively denied. Most certainly not upon the authority of the report, for, while giving the receipts from that source as $8,905 for the last two years, it ignores the nine years preceding. That the amount paid by such patients has been from $6 to $10 per week is not denied, nor are any of the material allegations of the critic in the *Louisville Medical Journal* specifically denied either by the figures of the report or by our correspondent. On the other hand, the report of the resident physician shows very clearly that the hospital and dispensary have not been devoted especially to the treatment of diseases peculiar to women, as specified in the act of incorporation, but that cases of alcoholism, epilepsy, maxillary necrosis, syphilis, tænia solium, etc., have figured prominently in the records of both. This, however, is a question of the interpretation of an act of Congress, upon which, within proper limits, reasonable differences in opinion may exist.

Our correspondent, one of the present Advisory and Consulting Board of Physicians and Surgeons, by the way, will therefore accept our excuses for declining to disavow the strictures condensed from the pamphlet in question, upon the insufficient data furnished by his letter and the accompanying report; and must, for the present, be content with our assurance that upon such facts being submitted as shall fairly refute the allegation of extravagant management, the earliest opportunity will be taken to place them before the medical public. Perhaps it may be well to assure him also that no special disrespect to the Board of Directors, further than to intimate that, granting the allegations of the critic, they did not exercise a sufficiently active supervision over the management of the hospital under Dr. Thompson's administration, was intended by the term "flexible," to which he excepts so strenuously. It is, no doubt, true that the statements of the critic were actuated by personal dislike. But that is not our affair, unless they are disproved.

Reviews and Notices of Books.

THE EAR; ITS ANATOMY, PHYSIOLOGY, AND DISEASES. By CHARLES H. BURNETT, A.M., M.D. Philadelphia: Henry C. Lea. 1877.

THIS treatise, as its title announces, is intended for the use of medical students and practitioners. It is a work of large size (over 600 pages), and is distinguished from all other existing treatises on the ear (in the English language) by the fact that an unusually large portion of the space is devoted to the anatomy and physiology of this organ. Hitherto students have almost sought in vain for a sufficiently minute and clear account of these two fundamental subjects.

They have been obliged to glean their knowledge from text-books of anatomy, from shorter monographs, and from magazine articles. In the present manual all the latest advances of any importance in the anatomy and physiology of the ear are embodied in the author's clear and well-arranged account.

The second portion of the treatise is devoted to the important subject of how to examine a patient. The author describes the different procedures clearly. His invective against the hard-rubber ear-syringe usually sold in the shops, will hardly be assented to by most aurists. On the other hand, the form of syringe which he advocates as "the model ear-syringe" is undoubtedly safer than the one which he condemns, but unfortunately the shape and size of its nozzle are such that with it very few patients could possibly cleanse their ears thoroughly.

Further along we find an excellent description of the proper way in which to introduce the Eustachian catheter. Not a word, however, is said of the use of the forehead-mirror in examining the deeper parts of the ear. This method, which enables the physician to use both his hands, requires perhaps a little more practice at the beginning than does the usual method of holding the mirror in one hand. After the physician, however, has once acquired the ability to use the forehead mirror in illuminating the deeper parts of the ear, nothing would probably induce him to return to the antiquated method which compels him to have an assistant whenever he performs paracentesis of the drum membrane.

The remainder of the volume is devoted to aural pathology and therapeutics. In the main the author has fulfilled this part of his task creditably. In the section relating to chronic catarrhal inflammation of the middle ear, one searches in vain for the slightest reference to the subject of prognosis. This oversight should be corrected in the next edition.

Finally, under the head of chronic purulent inflammation of the middle ear, we find the remarkable statement (p. 485), that the "solid stick [of nitrate of silver] should *never* be used." Again, in another place (p. 524), in describing the proper treatment of the stump left after the removal of a polypus, he states: "But at best the 'solid stick' is a dangerous application about the ear, and should, therefore, be kept out. A saturated, aqueous solution of nitrate of silver (480 gr. to f. ʒ i.) may be advantageously applied to the seat of the polypus and any surrounding granular surface, by means of a tuft of cotton on the cotton-holder." That strong solutions of nitrate of silver simply stimulate the growth of granulation-tissue, while the "solid stick," thoroughly applied, represses its growth, is a pretty well-established fact in surgery. An extensive experience in the use of the "solid stick" (in the form of a bead fused upon the end of a probe or cotton-holder) in the treatment of granulations (or stumps of polypi) in the middle ear, has convinced the writer of this review that such applications are not only very effective, but perfectly safe.

Notwithstanding the few defects (or differences of opinion) to which we have called attention, this new treatise on the ear cannot fail to prove a valuable addition to the physician's library. Books cannot teach him much about aural pathology and therapeutics until he has served a certain apprenticeship in aural examinations. This apprenticeship very, *very* few men are willing or able to serve. On the other hand, books can teach him—in connection with such dissections as every physician can make—a great deal about the anatomy and physiology of the ear, and certainly from no other one book in the English language can he acquire this knowledge better than from the one we have thus hastily reviewed.

1. A GUIDE TO THERAPEUTICS AND MATERIA MEDICA. By ROBERT FARQUHARSON, M.D., F.R.C.P. Lond., enlarged and adapted to the U. S. Pharmacopœia by Frank Woodbury, M.D. Philadelphia: Henry C. Lea. 1877. Pp. 410.

2. THE ELEMENTS OF THERAPEUTICS: A CLINICAL GUIDE TO THE ACTION OF MEDICINES. By DR. C. BINZ, Prof. of Pharmacology in the University of Bonn. Translated from the fifth German Edition, and edited with additions in conformity with the British and American Pharmacopœias, by Edward J. Sparks, M.A., M.B., Oxon. New York: Wm. Wood & Co. 1878. Pp. 347.

THE almost simultaneous appearance of these two works, the first a new one, the second new to most American readers, and the fact that they are both exponents of what may be called a new system of therapeutics, termed by its followers the "physiological," invests them with an unwonted interest, and invites a careful examination and critical consideration of the facts and doctrines on which it is based. In this preliminary notice, however, we cannot attempt a complete review of this large and increasing field of research, but must confine ourselves more particularly to an exposition of the special peculiarities and merits of the individual works before us.

1. FARQUHARSON.—In examining the American edition we have naturally compared it with the original, and shall base the majority of our remarks upon the latter, for the simple reason that in perusing the former we found ourselves continually mixing the editor with the author, in spite of a plentiful supply of brackets that served to mark the additions to the original text. After a very judicious consideration of the questions of combination of medicines, period of administration, relative value of large and small doses, idiosyncrasy, habit, accumulation, incompatibility, etc., the author proceeds to a consideration of the different drugs in succession. There is no attempt at classification, and the drugs follow each other without regard to physiological, chemical, or other apparent relationship. In the American edition the editor has arranged them alphabetically in accordance with the plan of the U. S. P. In the discussion of the individual drugs, however, the author has adopted a novel and somewhat striking method. It consists in arranging the assumed physiological actions of the medicine in one column, and its therapeutical uses in a parallel one. This will be most readily understood by the following extract:

"LEAD.

LOCAL ACTION.

Physiological.	*Therapeutical.*
'The external action,' etc.	'Lead in the form,' etc.

INTERNAL ACTIONS AND USES.

1. *Brain and Nervous System.*—'When lead,' etc.	
2. *Heart and Circulation.*—'During the action,' etc.	2. 'This contractile influence,' etc.
3. *Intestinal Tract.*—'A prominent symptom of chronic lead poisoning is obstinate constipation,' etc.	3. Acetate of lead is an excellent astringent in diarrhœa, more especially that of phthisis and British cholera. Dr. Thorowgood has obtained good results from lead in obstinate obstruction of the bowels."

We fail at this point to perceive the relationship between the physiological action of the drug and the clinical results obtained by Dr. Thorowgood.

To the author's text the editor adds a list of the officinal preparations of lead with doses, etc.

The remaining drugs are considered in the foregoing manner. It is somewhat unfortunate that the lack of correspondence between the physiological effects and the results of clinical experience, as above indicated, form the rule rather than the exception throughout the whole work. In some instances, however, a reconciliation is attempted by means of explanations remarkable for ingenuity rather than soundness.

We are sorry to state that the work contains numerous errors, as on page 65 (Eng. ed.). "Alkalies" are said to be the antidotes to ammonia poisoning. Under the heading, "Acidum citricum," the author states that 17 grains of this substance neutralize "20 grains of bicarbonate of soda" or "35 grains of carbonate of soda." On page 85 (Eng. ed.), he says that "the familiar black wash" is "calomel *dissolved* in lime-water" (italics our own). We regret that these peculiarities have escaped the attention of the editor. On page 92 (Eng. ed.), we find "℞. Hydrargyri chloridi, gr. ij.; pulveris opii, gr. ¼; confectionis rosæ q. s., ut fiat pilula quartâ quâque horâ sumendâ." We confess that we were sorely puzzled by this prescription, as the expression "Hydrarg. chloridum" is not officinal in the Br. Ph., and its recent employment in a prescription in this city resulted in a serious accident. In the American edition Dr. Woodbury has changed the Hyd. chlor. to Pil. hydrargyri, a substitution which the context appears to fully warrant.

On the whole, the work is rather carelessly written, and not fully revised, but the American edition possesses in addition the extracts from the pharmacopœia, notices of several new remedies, and a series of "Questions in Materia Medica," that are well worth perusal.

2. BINZ.—We rise from a careful perusal of this work with feelings of extreme satisfaction, in part due to the subject-matter itself, and in part to the concise but clear manner in which it is expressed. It has not been our fortune for a long time to study a work in which it was evident that the author was so completely conversant with his subject, and had so thoroughly sifted the materials of which he was to make use. The book consists of twelve chapters, each devoted to certain groups of medicines, as nervina depressoria, nervina excitantia, adstringentia, plastica, etc. Chapter 1. opens with the statement that "most neurotic drugs act on certain parts of the nervous system more rapidly and distinctly than upon others, or else they affect some part of it very violently and the rest not at all. Probably this is due to differences in the chemical affinities of these parts." This idea, that many if not most drugs have special affinities for different portions of the organism, prevails to a great extent throughout the work, and reminds us of the organopathy of Rademacher, and of the similar but cruder notions of still older writers. That this idea is in the main correct, the work before us, as well as modern physiological experiments generally, affords abundant evidence. How far it may be utilized for therapeutic purposes, clinical observation can alone decide. The main features of the work are a condensed statement of the results of physiological research in connection with the different drugs, and the exceedingly practical character of the advice which is given regarding their administration. Speaking of hypodermic injections of morphia, the author says that they are "only suited to such chronic cases as are incurable, or to cases in which the effects of disease are less tolerable than those which morphia induces." . . . . "In consequence of the proximity of large blood-vessels, and of the possible danger that the poison (morphia) may reach the nervous centres insufficiently diluted, it is advisable, if possible, to avoid the neighborhood of the head and neck altogether as the seat of injection." Of atropia, he says that it "has been much used subcutaneously in treating certain neuroses, but owing to the severity of some of its attendant phenomena, and especially of delirium, it is necessary to employ it in this way *with the utmost caution*." Of lobelia: "its efficiency seems to be partly dependent on the conditions under which the plant is grown. At any rate, the reports founded on the use of the cultivated variety in Germany cannot be trusted, while those which deal with the wild American plant are more reliable." The great difference in the medicinal effects of the two varieties of Cannabis sativa, distinguished pharmaceutically as C. Indica and C. Americana, is well recognized; but the comparative values of other medical plants grown in different countries have not been as fully investigated as the importance of the subject demands. Of conium: "its active constituent is the liquid conia (officinal in Germany), and it contains a much smaller quantity of another crystalline alkaloid conydrin. . . . . We should expect from the volatility of conia that there would be none of it left in the dried plant, and this appears to be the case. It is irrational, therefore, to use any but the fresh drug, or, at most, the yellow alkaloid." The articles on opium, belladonna, salicylic acid, and quinia are worthy of special study. At the end of each article the editor has appended a list of the preparations officinal in the British and United States Pharmacopœias, together with their doses.

The work appears to have been written with great care, and bears the impress of reliability, and is a volume that we do not hesitate to recommend in the strongest manner.

TRANSACTIONS OF THE WISCONSIN STATE MEDICAL SOCIETY. 1877.

IF the medical profession in the far Northwest is in the habit of doing such thorough work as is represented in this pamphlet of 150 pages, our metropolitan physicians must look to their instruments if they would maintain their hegemony in operative surgery, and to their pens if they would hold their supremacy in medical literature. Exclusive of President Bartlett's address and of routine matter, the report contains sixteen articles, led off by a lecture from Dr. Kempster, of Oshkosh, on the "Brain in Health and Disease," which compares favorably both in method of investigation and caution of statement with the work of the best German master in psycho-physics. Dr. F. H. Day, of Wauwatosa, prefaces with a report on practical medicine in the State, a group of able articles, of which Dr. Wenzel's on the "Etiology of Typhoid Fever," and Dr. Barnett's on the "Treatment of Scarlatina," are noticeable for scientific precision and practical suggestiveness. Adopting the ferment theory of the disease, Dr. Barnett discusses the relative value of such antizymotics as sulphite, bisulphite, hydrosulphite, and sulphocarbolate of soda, and salicylic acid, giving his preference to the sulphocarbolate, and suggesting belladonna, digitalis, and alcoholic combinations as appropriate cardiac stimuli. Dr. Senn's report on operative surgery describes a large and varied series of cases and operations, with the minuteness essential to practical value; and under the caption of "Uterine Diseases," the hints of Dr. Fox relative to the best methods of correcting displacement are worthy the attention of gynecological experts as well as of professional tyros. Dr. George W. Jenkins, Kilbourn City, reports two interesting cases of embolism; Dr. E. W. Bartlett, Milwaukee, a

successful transplantation of the conjunctiva, and Dr. M. M. Davis, Baraboo, a successful treatment of tumor of the neck by hypodermic injections of nitrate of silver. The pathological report of Dr. C. L. Stoddard, Whitewater, abounds in valuable memoranda of cases.

NEW YORK ACADEMY OF MEDICINE.

SURGICAL SECTION.

Stated Meeting, Nov. 13, 1877.

DR. STEPHEN SMITH, CHAIRMAN.

THE paper read by Dr. L. M. Yale,

ON CERTAIN CONSIDERATIONS RESPECTING THE MECHANICAL TREATMENT OF CHRONIC DISEASE OF THE JOINTS, WITH ESPECIAL REFERENCE TO THE USE OF TRACTION (see p. 24).

being before the Section for discussion, DR. A. C. POST remarked that he thought the author of the paper had unintentionally slandered our fathers in the profession by making the statement that all articular diseases were regarded as constitutional, and that they were treated only by constitutional means. For long before the present mechanical treatment of joint affections came into use, it was a common practice to treat articular disease as a local inflammation, and by the use of the local remedies supposed to be the best adapted to subdue such inflammation, without regard to diathesis. It was common to employ leeches, cups, blisters, moxas, etc., including the actual cautery. He was of the opinion that the reader had overlooked that fact, and that in that respect the statement in the paper should be corrected.

DR. YALE remarked that he intended to speak with special reference to mechanical treatment.

DR. POST continued by saying that the treatment of joint disease by rest was not of very modern origin, although for some time it was but little used. Comparatively little, however, had been done in the way of making extension and counter-extension, until within the past few years. The paper was regarded as one of very great interest, and one which gave correct views regarding the mechanical treatment of articular affections.

DR. WEBER remarked, with reference to *massage*, to which the author of the paper had referred, that it was a very old method of local treatment, and had been used very largely with a view of benefiting joints which were in a state of chronic inflammation. It would be well, therefore, to modify the statement that mechanical treatment had not been used until quite recently. With reference to the presence of a strumous element in joint diseases, Dr. Weber related the history of a case under observation, which seemed to show that a similar cachexia could be developed by improper nutrition and hygiene in one not having any hereditary tendency thereto. In his case the pain in the diseased joint ceased on the second day after the application of a mechanical apparatus that secured perfect rest; the general febrile movement was also diminished. But at the end of nine days, no constitutional treatment having been adopted, the appearance of the joint remained unchanged. The mechanical appliance was continued, cod-liver oil with the syrup of the iodide of iron was administered, and the improvement at once became marked and rapid.

DR. LEWIS A. SAYRE remarked that there was one point in the paper which he thought should be corrected, namely, that the principle of traction in the treatment of joint affections originated empirically. He believed that to the late Dr. Alden March, of Albany, the credit should be given of first directing the attention of the profession to the use of traction in the treatment of joint disease. It was done in a paper in which he gave his reasons for employing traction in the treatment of hip-joint disease. The reasons assigned were that interstitial absorption was produced in the head of the bone and the acetabulum because of the incessant pressure caused by the reflex contractions of the muscles acting upon the joint, and Dr. March's idea was to correct that tendency by making traction upon the limb. It could hardly be said, therefore, to have an empirical origin, and he would be pleased to have Dr. Yale correct his paper in that particular.

DR. POST remarked that there was nothing offensive in the term empiricism as used, for it simply meant "as the result of clinical experience." It was proper, in many instances, to treat disease in the line of clinical experience, notwithstanding we might not be able to reason exactly how the treatment operated.

DR. C. FAYETTE TAYLOR exhibited sketches and photographs of interesting cases of joint disease. He was of the opinion that perhaps our ideas with reference to anchylosis in Pott's disease should be corrected. In a case related, motion, after recovery, was present in the five vertebræ involved.

DR. GIBNEY was happy to hear the reconciliation brought about by Dr. Yale, namely, that joint diseases should be treated both constitutionally and mechanically.

DR. GOODWILLIE related the history of a case in which the temporo-maxillary articulation was the seat of chronic disease. Almost immediate relief was afforded by the use of an interdental rubber splint.

DR. JUDSON thought that one point might with propriety be emphasized rather more than it had been, and that was the giving of mechanical protection to diseased joints from concussion in locomotion, and from the weight of the body while standing. That feature in the treatment of hip disease had not received the attention it should, although the pad attached to the long splint employed in the treatment of that affection was a *step* in the right direction.

DR. SAYRE referred to the liability to do damage by making excessive traction. It was a mistake very commonly made. Only so much traction was required as was necessary to make the patient perfectly comfortable; more than that was absolutely injurious.

DR. POST referred to the value of issues established by the actual cautery in the treatment of certain obstinate cases of chronic disease of the joints.

DR. SAYRE corroborated Dr. Post's remarks upon that point.

After extending a vote of thanks to Dr. Yale for his paper, the Section adjourned.

MEDICAL SOCIETY OF THE COUNTY OF NEW YORK.

Stated Meeting, Dec. 17, 1877.

DR. JOHN C. PETERS, PRESIDENT, IN THE CHAIR.

REPORT OF THE COMMITTEE ON ETHICS.

DR. R. J. O'SULLIVAN, from the Committee on Ethics, made a report, which was referred to the Comitia Minora.

ON THE THERAPEUTIC USES OF SOME OF THE RANUNCULACEÆ, ESPECIALLY IN NERVOUS DISEASES.

THE PRESIDENT read a paper upon the above subject, in which brief reference was made to the therapeutic uses of hydrastis canadensis, podophyllum, pulsatilla, actæa racemosa, aconite, staphisagria, and helleborus niger.

While studying the history and the characteristics of each of these drugs, the historical point was brought out that it was Baron Stoerck who first performed experiments upon healthy persons with reference to the action of certain medicines. Pulsatilla, as a remedy, had its origin among the Arabians, and was used by them in the treatment of malarial fevers. It was thought that this remedy could be employed with advantage much more extensively than it was at the present time.

DR. H. G. PIFFARD regarded pulsatilla as a remedy that should be used more extensively. He had employed alcoholic preparations of the drug in dysmenorrhœa complicating acne, and in epididymitis, with good results. In two out of three cases of dysmenorrhœa treated the relief has been rapid and complete, and continued six or eight months. In acute epididymitis the pain was relieved in from six to twenty-four hours, and all was accomplished that ordinarily followed the use of tobacco poultices, or recourse to the emeto-cathartic plan of treatment. The swelling did not subside as rapidly as did the pain. Special attention was directed to the fact that a reliable preparation could only be made from the *fresh* plant, and perhaps one reason why the *use* of the remedy had not been followed by more satisfactory results was because the preparations employed had been made from the dried plant.

DR. PUTNAM-JACOBI believed that podophyllum acted by producing a primary irritation upon the peripheral extremities of nerves spread out upon the mucous membrane, that that impression was transmitted to central ganglia, and that those ganglia sent out motor influences to the muscular fibres in the coats of the gastro-intestinal tube, and also to the liver, rather than by acting upon the termination of the bile-duct in the duodenum, as suggested by the author of the paper.

The action of aconite was believed to be inhibitory with reference to the cardiac ganglia.

DR. LEALE referred to two cases of death produced by the administration of podophyllin. The dose prescribed by Stillé was two grains, but one and one-half grains had been administered to a woman in the sixth month of pregnancy; it produced an active effect and the movements of the fœtus ceased. He was called in consultation, and was not able to discover any fœtal heart-beats. The child was carried to term, and when delivered had the appearance presented at six months' development.

In the second case a horse-farrier, accustomed to prescribe for horses, took twenty grains, and a fatal result was produced.

DR. G. H. FOX corroborated the statements made by Dr. Piffard regarding the use of pulsatilla in the treatment of epididymitis.

DR. SELL referred to the use of several of the remedies mentioned, and to certain special conditions in which he had found them useful.

The Society then adjourned.

DR. JURECKI, who was killed before Kars, is the only Russian surgeon who has fallen in the present war, Ugrinmow, a surgeon of the Bulgarian contingent, was wounded at Shipka.

New Instrument.

LEVER EXSECTION SAW.

BY B. A. WATSON, M.D.,

SURGEON TO JERSEY CITY CHARITY AND ST. FRANCIS' HOSPITALS, JERSEY CITY, N. J.

THE above engraving represents an instrument intended to take the place of the chain-saw, and the inventor believes that surgeons will find it more satisfactory. The complete instrument consists essentially of a frame, a lever saw, and an adjuster. The frame is composed of an oval top and lateral bars. The appendages of the former are lateral handles and a transverse bar. The top of the frame and the transverse bar each contain a slot through which the lever passes, and is moved while the instrument is in use, and at the same time the lateral handles are required

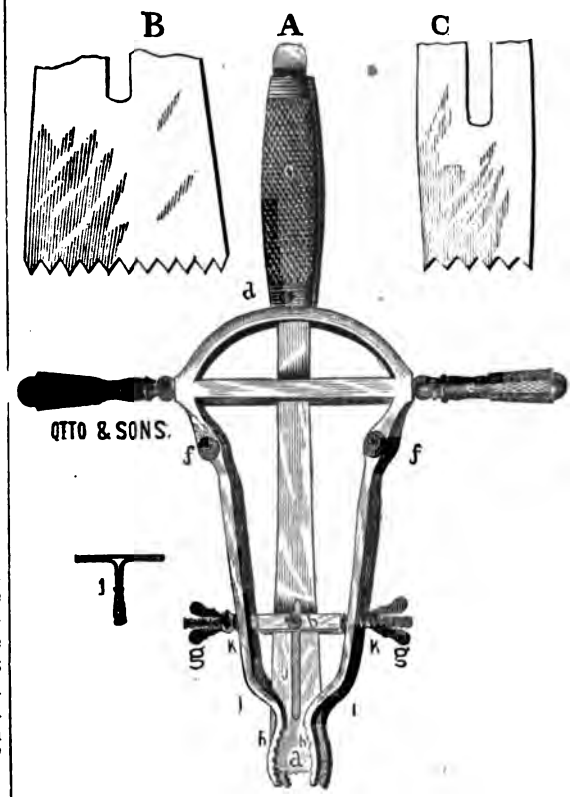

FIG. 1.—*A*, complete instrument; *a*, saw; *b*, fulcrum; *c*, sliding handle; *d*, screw by which handle is made immovable; *ee*, lateral handles; *ff*, joints; *gg*, adjuster-screws; *hh*, double clasps; *ii*, slots in clasps; *j*, slot in saw; *kk*, slots in lateral bars; *l*, key.
B, wide saw; *C*, narrow saw.

to give the instrument the necessary steadiness. The lateral bars on each side are connected with the top of the frame by means of hinge-joints. These joints may be rendered immovable by the key which is fitted to the screws which hold the different parts of this structure together. In each lateral bar there is a slot two inches in length, through which the adjusting bar (of saw) passes. These slots contain three cup-like depressions, intended to receive the rounded head of the screws, by means of which the adjustment of the

saw may be made at any fixed point. The lower portions of the lateral bars are shaped so as to form clasps which firmly seize and hold the bone while the saw is in motion. In each clasp there is a slot which allows the requisite freedom of motion to the saw.

Each instrument is furnished with two saws, which differ mainly in the extent of their cutting surfaces; the wide one being a fraction more than one inch, and the narrow one being a fraction more than one-half an inch. About one inch above the cutting edge in each saw a slot commences and extends two inches upwards; this slot receives the fulcrum which passes through the adjusting bar, and while this bar remains stationary the saw simply gravitates downward as the act of sawing progresses. The saw and lever are made into a single piece of steel, which is of uniform thickness throughout. The handle is movable, and may be fixed at any distance from the cutting edge of the saw by means of the screw. The adjuster consists of a bar and two screws.

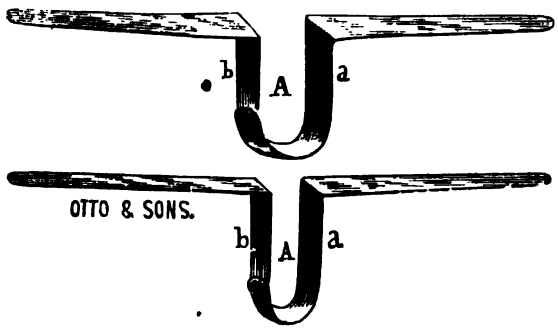

FIG. 2.—*AA*, protectors; *aa*, long arms; *bb*, short arms.

This figure represents instruments designed for the protection of the soft parts while the saw is in use. The wide one is used with the wide saw, and narrow one with the narrow saw. The mechanism of these protectors is so simple that no further description will be necessary.

In using this instrument the first step in the operation is to separate the soft parts from the bone; this being done, the surgeon takes the long arm of the protector, and with the fenestrated end in contact with the bone carries it under the bone to the opposite side, where he joins the arms of the protector through the hook and fenestrum. The saw is now raised in the frame, and the clasps are placed on the bone; the adjusting and joint-screws are firmly tightened by the key. This latter precaution is especially necessary in all cases of irregularities in the surfaces of the bone. The shape and structure of the clasps enable them to hold round bones with the greatest firmness. The instrument is now ready for use, and no further explanation is required to enable the practical surgeon to use it successfully. It is believed to possess especially the following advantages over the chain-saw:

1st. It is not liable to break, and consequently there should be an entire absence of the usual interruptions during an operation.

2d. The bone is firmly clasped, and therefore there cannot be the same trouble in making the section. This point is especially applicable while making the second cut.

3d. The exsection can be made much more rapidly.

The instrument is manufactured and sold by Messrs. F. G. Otto & Sons, New York City.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from Dec. 30, 1877, to Jan. 5, 1878.

MURRAY, R., Colonel and Surgeon.—Announced as Medical Director of the Division. G. O. 1, Mil. Division of the Missouri, Jan. 2, 1878.

ALEXANDER, R. H., Major and Surgeon.—Granted leave of absence for four months, from Jan. 1, 1878. S. O. 1, A. G. O., Jan. 2, 1878.

CARVALLO, CARLOS, Capt. and Asst. Surgeon.—Granted leave of absence for one month, and permission to apply for ten days' extension. S. O. 1, Dept. of the Missouri, Jan. 2, 1878.

BUCHANAN, WM. F., Capt. and Asst. Surgeon.—Granted leave of absence until April 1, 1878, and his resignation accepted by the President, to take effect April 1, 1878. S. O. 2, A. G. O., Jan. 3, 1878.

Medical Items and News.

CONTAGIOUS DISEASES IN NEW YORK FOR 1876 AND 1877.—Comparative statement of cases of Contagious Disease reported to the Sanitary Bureau, Health Department, for the two years 1876 and 1877.

YEARS	Typhus Fever.	Typhoid Fever.	Scarlet Fever.	Cerebro-Spinal Meningitis.	Measles.	Diphtheria.	Small-pox.

Jan. 5, 1878....	0	9	85	2	70	66	0

THE TREATMENT OF ABORTION.—Our attention has been called to some typographical errors in Prof. Penrose's lecture on abortion in the number of RECORD for December 29th. At the bottom of page 819, 2d column, instead of giving the woman *two grammes* of opium by the rectum, it should be two *grains*. The former dose would not only prevent a given abortion, but all others in the same subject. On page 820, the dose of five drachms of bromide of potassium is an obvious absurdity.

RHODE ISLAND MEDICAL SOCIETY.—The quarterly meeting of the Rhode Island Medical Society was held December 19th. Dr. E. T. Caswell read a paper on Fracture of the Spine, Dr. Garvin a paper on Alimentation in Disease, Dr. Capron a paper on Placenta Prævia.

STUDIES IN PATHOLOGICAL ANATOMY.

By FRANCIS DELAFIELD, M.D.,

Adjunct Professor of Pathology and Practice of Medicine in the College of Physicians and Surgeons; Visiting Physician and Pathologist of the Roosevelt Hospital; Visiting Physician and Curator of Bellevue Hospital.

IN ROYAL OCTAVO PARTS.

Each containing from two to four full-page Lithographic Plates in tint, and in color, with accompanying explanatory text. ☞ These studies will form, when completed, a treatise on Pathological Anatomy of exceptional value, especially for the remarkable fidelity of the illustrations, their minute and elaborate detail. The Parts will be published regularly, the first of each month, and sent to subscribers carefully rolled to protect the Plates from injury.

Subscription Price, $5.00 a Year.

INVARIABLY IN ADVANCE.

Single Parts, 50 cents each. **Part I. will be published February 1st.**

☞ SPECIMEN COPIES WILL BE SENT ON RECEIPT OF 50 CENTS.

Address the Publishers, WILLIAM WOOD & CO.,
27 Great Jones Street, New York.

HOUSE FOR SALE 6

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachm.
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its present sale exceeds $100,000 per year at wholesale. Its almost universal adoption by the profession, as the above figures show, is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK's preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proven itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

NEW YORK, *April 6th*, 1875.

J. R. LEAMING, M.D.,
Attending Physician at St. Luke's Hospital.

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

J. H. TYNDALL, M.D.,
Physician at St. Francis' Hospital.

LEWIS A. SAYRE, M.D.,
Professor of Orthopœdic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

EDWARD G. JANEWAY, M.D.,
Professor of Pathological and Practical Anatomy, and Lecturer on Materia Medica and Therapeutics and Clinical Medicine, Bellevue Hospital Medical College.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

PURE COD-LIVER OIL.

Manufactured on the Sea-Shore by HAZARD & CASWELL, from Fresh and Selected Livers.

The universal demand for Cod-Liver Oil that can be depended upon as strictly pure and scientifically prepared having been long felt by the Medical Profession, we were induced to undertake its manufacture at the Fishing Stations, where the fish are brought to land every few hours, and the Livers, consequently, are in great perfection.

This Oil is manufactured by us on the sea-shore, with the greatest care, from fresh healthy Livers of the Cod only, without the aid of any chemicals, by the simplest possible process and lowest temperature by which the Oil can be separated from the cells of the Livers. It is nearly devoid of color, odor, and flavor—having a bland, fish-like, and, to most persons, not unpleasant taste. It is so sweet and pure that it can be retained by the stomach when other kinds fail, and patients soon become fond of it.

The secret of making good Cod-Liver Oil lies in the proper application of the proper degree of heat—too much or too little will seriously injure the quality. Great attention to cleanliness is absolutely necessary to produce sweet Cod-Liver Oil. The rancid Oil found in the market is the make of manufacturers who are careless about these matters.

Prof. PARKER, of New York, says: "I have tried almost every other manufacturer's Oil, and give yours the decided preference."

Prof. HAYS, State Assayer of Massachusetts, after a full analysis of it, says: "It is the best for foreign or domestic use."

After years of experimenting, the Medical Profession of Europe and America, who have studied the effects of different Cod-Liver Oils have unanimously decided the light straw-colored Cod-Liver Oil to be far superior to any of the brown Oils.

COD-LIVER OIL, with IODINE, PHOSPHORUS, and BROMINE.—This combination represents Phosphorus, Bromine, Iodine, and Cod-Liver Oil in a state of permanent combination, containing in each pint: Iodine, eight grains; Bromine, one grain; Phosphorus, one grain: Cod-Liver Oil, one pint.

COD-LIVER OIL, with PHOSPHATE OF LIME.—This is an agreeable emulsion, holding three grains Phosphate of Lime in each tablespoonful.

COD-LIVER OIL, with LACTO-PHOSPHATE OF LIME.

IODO-FERRATED COD-LIVER OIL.—This combination holds sixteen grains Iodide of Iron to the ounce of our pure Cod-Liver Oil.

JUNIPER TAR SOAP.—Highly recommended by the celebrated ERASMUS WILSON and has been found very serviceable in chronic eczema and diseases of the skin generally. It is invaluable for chapped hands and roughness of the skin caused by change of temperature. It is manufactured by ourselves from the purest materials, and is extensively and successfully prescribed by the most eminent physicians.

FLUID EXTRACT COCA.

NERVINE, STIMULANT. USED IN PERU and BOLIVA as a MASTICATORY.

This Extract contains the entire properties of the leaf of the **Erythroxylon Coca.**

COCA WINE.

This Wine has been successfully used in France as a **tonic,** and found very desirable where a more mild effect of the Coca than the Fluid Extract was desired.

SOLUTION FERROUS CHLORIDE.

This Solution of Iron is the lowest form of Chloride. It is much less Styptic in taste than Tr. Iron Chloride, consequently pleasanter to the patient; is much more easily assimilated by weak and irritable stomachs.

Knowing how difficult it is to introduce into the blood, in a proper form, a sufficient quantity of iron to be beneficial, we have manufactured and introduce the **Ferrous Chloride** as being easily absorbed and acting with much efficacy, even when given in small doses.

RELIABLE ANIMAL VACCINE.

The undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*
This **Animal Vaccine** can be obtained at CASWELL, HAZARD & Co's., Broadway, cor. 24th Street.

FRANK P. FOSTER, M.D.

We have an arrangement with Dr. Foster by which we receive this Vaccine ***fresh daily.***
By this arrangement all supplied by us ***is absolutely fresh.***
We can furnish it in any quantity desired, either by express, or by mail, if remittance is made to cover postage.
Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified indorsement of the medical profession of New York

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia Magnesia and Bi Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

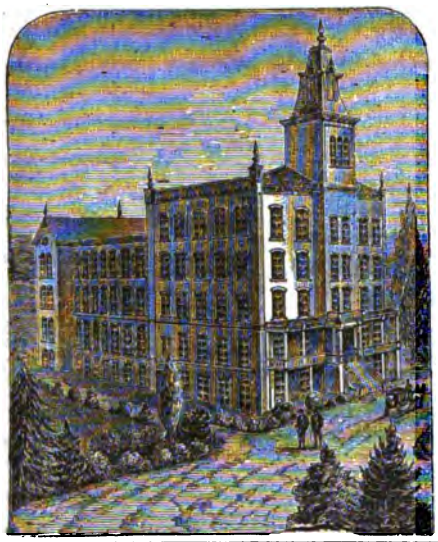
In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Care.*

Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York**, will receive prompt attention.



THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.

INCORPORATED 1866.)

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors; billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton [L. I.]. N. Y.

McKESSON & ROBBINS'

Gelatine-Coated Pills and Granules.

We take occasion to thank the profession and trade for their patronage of our **GELATINE-COATED PILLS**, and request a continuance of the same. Full lines of our Pills have been established in all the large centres of trade, and in many of the smaller cities. To those living in remote places we will be happy to mail any formulas on our list, not procurable nearer home, upon receipt of price.

We regret to announce that our attention has been called to several instances where other pills have been substituted by druggists when ours were desired, and even specified, by the physician. We believe that such instances are rare, but in some cases physicians have notified us of such breach of honor in the druggist.

☞ **New additions to List. Send for full Price List of our Pills.**

McKESSON & ROBBINS' PILLS ARE SPHEROIDAL OR CAPSULE SHAPE. Specify McK. & R.

CHARCOAL (Willow) 5 grs.....60 per 100

The value of pure powdered Willow Charcoal in Dyspepsia, Indigestion, and all affections arising from derangements of the stomach, such as Headache, Heartburn, etc., is well known. Its use must necessarily be much increased, since it is, for the first time, presented in a convenient, reliable, and unobjectionable form in our Gelatine-coated Pills.

EXTRACT CANNABIS INDICA, ½ gr. $1.25 per 100.

This important extract is manufactured in our own laboratory, and the pills, when cut, exhibit in a marked manner, the distinctive color, taste, and odor of the freshly-made extract. We copy from the U. S. Dispensatory the following: "In morbid states of the system it (*Ext. Cannab. Indic.*) has been found to cause sleep, to allay spasms, to compose nervous inquietude, and to relieve pains: it differs from opium in not diminishing the appetite, checking the secretions, or constipating the bowels." "The complaints in which it has been specially recommended are neuralgia, gout, rheumatism, tetanus, hydrophobia, epidemic cholera, convulsions, chorea, hysteria, mental depression, delirium tremens, insanity, and uterine hemorrhage."

For doses, see U. S. Dispensatory.

SALICIN, 2½ and 5 grs.....$2.50 and $4.50 per 100.

Salicin is becoming more and more favorably known in the treatment of rheumatic affections; also as a tonic and antiperiodic, and is best exhibited in our Gelatine coated Pills.

In acute rheumatism, Salicin has been found very efficacious, and, according to *The Lancet*, "not less certain than Quinine, for ague." It has also been claimed, in large doses, to be an absolute specific in ulcerative choroiditis.

COCA EXTRACT, 1 gr. (McKesson & Robbins') $2.00 per 100.

The extract used in these pills is manufactured in our laboratory from fresh leaves. Coca is a South American plant, used by the natives as a substitute for tea, coffee, tobacco, hashish, and opium of other countries. It imparts vigor to the muscles as well as to the intellect, and enables the partaker to endure great fatigue with ease. The feeling of exhilaration accompanying its use is said not to be followed by any depressing effects.

Dose, 1 to 4.

JABORANDI EXTRACT, 3 grs...$3.00 per 100. (Made of McKesson and Robbins' Extract.)

These pills present a much better form of administering this powerful diaphoretic and sialagogue than any of the liquid preparations. Valuable in rheumatism and syphilitic troubles of long standing. Dose, 1 to 3.

SANDAL-WOOD EXTRACT, 1 and 2 grs. $2.00 and $3.00 per 100.

These pills contain both the oil and resin existing in sandal-wood, are believed to be superior to the oil alone, and are more convenient of administration. The extract is manufactured from the wood, in our laboratory.

SALICYLIC ACID with SULPHATE MORPHIA, ...$1.25 and $2.00 per 100.

Two sizes containing 2½ and 5 grains Salicylic Acid, united with 1-12 and ¼ grain Sul. Morphia respectively. Strongly recommended in Rheumatism, both acute and chronic.

QUINIDIA SULPH., 1, 2 and 3 grs., .80, $1.50, and $2.20 per 100.

CERIUM, OXALATE, 1 gr . .... 1.00 per 100

ALOIN, 1 gr..... .. .... 1.50 per 100.

SULPHIDE CALCIUM, 1-10 gr... 75 per 100.

CITRATE CAFFEIA, 1 gr..... 4.00 per 100.

FERROCYANIDE IRON, 3 grs.. 60 per 100.

DIALYSED IRON (Merck's scales) 2 grs. $1.25 per 100.

VALERIANATE of AMMONIUM, 1 gr. $1.00 per 100.

MONOBROMATED CAMPHOR, 2 and 3 grs. $1.50 and $2. per 100.

It is now being considerably used in treatment of Spermatorrhœa; strongly recommended in cases of Cerebral-Anæmia; used successfully in Infantile Convulsions from teething; Hysteria, Headache from over study or nervousness, and Nymphomania. Dose, 3 to 4 grains.

ERGOTIN PILLS, 3 grs... .....$2.00 per 100.

We manufacture our Ergotin with great care from the best quality of fresh selected Ergot, and it contains in the most potent form all the active constituents of Ergot of Rye, each grain representing 10 grains of Ergot, and each pill being equal to half a teaspoonful of official fluid extract. The value of Ergotin in the place of the crude drug and the fluid preparations is conceded; and it is being largely administered both in this country and in Europe. It has taken a prominent place in the treatment of neurotic diseases. Many of our most reliable practitioners, and particularly those of extended experience in gynecology, assert that they have never found a preparation of Ergot, in which, by experience, they felt as much confidence as in McKesson & Robbins' Ergotin Pills. The advantages of prescribing it in this form will be readily acknowledged. Dose, 1 to 3.

We offer our Ergotin, prepared specially for hypodermic use in one ounce bottles, $1.50 per oz.

PHOSPHORUS, 1-100, 1-50, 1-30, 1-12 gr. $1.00 per 100.

The pure transparent Gelatine we use is in no degree porous, it preserves the Phosphorus perfectly in the free state. We have the Phosphorus in state of solution in the excipient we employ, this insures a gradual elimination of the Phosphorus in the stomach, thus avoiding the severe irritation that is so often experienced after taking the ordinary Phosphorus Pills, which are prepared by mixing the Phosphorus in substance with the excipient, in which small fragments of Phosphorus often remain. Note remarks by Dr. Squibb, in his paper before Am. Pharm. Ass'n, Sept., '76, in which he states that Phosphorus should never be administered in substance, and if a coating be used, he commends Gelatine.

Many of the most eminent Physicians throughout the country, among whom are leading specialists in the treatment of Neurotic diseases, assert that McKesson & Robbins' Phosphorus Pills are the most rational medium yet found for exhibiting Phosphorus.

PHOSPHORUS COMPOUND, 1-50, 1-60, and 1-100 gr. ... .$1.25 per 100.

PHOSPHORUS COMPOUND AND IRON, $1.25 per 100.

Price Lists and Samples furnished upon application. Private formulas of 3,000 or more pills made and coated to order.

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists, 91 Fulton St., New York.

NOTE. In reply to inquiries in regard to CHANGE IN COLOR of our QUININE PILLS, we beg to state that the change is due to our using PURE WHITE SULPHATE OF QUININE, instead of UNBLEACHED of the guaranteed standard of 90% Sulphate of Quinine, as formerly, (the custom having been to employ 111 ounces of Unbleached Quinine, in place of 100 ounces of White Quinine.) This change to White has been made to avoid misrepresentation. The mass of our Pills has also been greatly improved, in appearance and solubility, by the use of our new excipient. Respectfully,

McKESSON & ROBBINS.

See Advertisement of McKESSON & ROBBINS' GRANULES, Gelatine-Coated, see No. 375, Page 32.

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL, and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist.

PHYSICIANS' SUPPLIES OF ALL KINDS.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HÆMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of **CASWELL, HAZARD & CO., New York,** and of all respectable Chemists throughout the world.

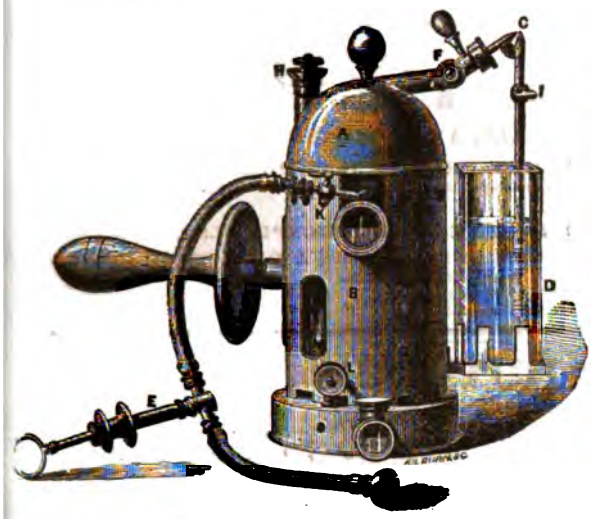
THE ANTISEPTIC ATOMIZER.



In this apparatus we have incorporated some of the best features of the Atomizing Apparatus heretofore made by us, already familiar to the profession. It is of best materials and workmanship—strong, durable, convenient, easily regulated, and by means of a new attachment of our own design, adequate without cessation of spray for any operation, or series of operations, however extended. Full description on application.

A NEW PAMPHLET

On Atomization of Liquids, with Formulæ of many articles of the Materia Medica successfully employed in the practice of a well-known American Practitioner, together with a description of the best forms of apparatus, will be sent post-paid on application. Also our new illustrated Catalogue of Surgical Instruments.

ATOMIZING APPARATUS BY COMPRESSED AIR.

This apparatus will be found entirely satisfactory on account of its elegance and perfect working qualities. It has a double acting Brass Pump (condensing or exhaust, at will), with valves unchangable by time or use. Strong Copper Receiver, Nickel Plated, 12 feet, light and flexible but strong; brown-colored Tubing and a self-closing cut-off (our own design, represented at I), readily connected with any tubes now in use.

BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

DOCTOR CLIN'S

(Laureate of the Faculty of Medicine of Paris. Prix Monthyon.)

CAPSULES AND DRAGEES

Of Bromide of Camphor.

"These remedies are prescribed when it is necessary to produce an energetic sedation on the circulatory system, and particularly on the nervous cerebro-spinal system.

"They constitute one of the most energetic *anti-spasmodic* and *hypnotic* medicines."—*Gazette des Hopitaux.*

"*Dr. Clin's Capsules and Dragees of Bromide of Camphor* are those employed in all the experiments made in the hospitals of Paris."—*Union Medicale.*

Dr. Clin's Capsules contain 4 grains, and the Dragees 2 grains, of genuine Bromide of Camphor.

N.B.—*Dr. Clin's Gluten Capsules* are very rapidly dissolved in the stomach, and should be preferably employed for a long treatment, and when the administering of Bromide of Camphor at a great dose would be considered as beneficial.

Prepared by CLIN & CO., Pharmacists, Paris.

DUCRO'S ALIMENTARY ELIXIR,

A Combination Uniting the Properties of Alcoholic Stimulants and Raw Meat.

This preparation, which has been used with great success in the hospitals of Paris since 1868, is adapted to the treatment of all diseases requiring the administration, in a small volume, of a tonic able to stimulate and support the vital forces, as *Pulmonary Phthisis, Depression* and *Nervous Debility, Adynamia, Malarious Cachexia*, etc.

Prepared by DUCRO & CIE, Paris.

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

In corresponding with Advertisers please mention **The Medical Record.**

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of 1-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

Added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians referring to it in terms of high praise.

MANUFACTURED BY

TROMMER EXTRACT OF MALT CO.,

FREMONT, OHIO.

We are, therefore, fitting all our Physicians' vehicles and other fine carriages with

THE RUBBER CUSHIONED AXLE.

This great improvement secures the essential objects sought for in every vehicle, viz., **SAFETY, COMFORT,** and **ECONOMY,** and its use indisputably assuring these important and valuable qualities, it is now accepted as an

INDISPENSABLE FEATURE

in carriage building wherever **PERFECTION,** or a near approach to it, is sought to be attained.

Axles in use, where the arms are not much worn, can be altered, using the same wheels if the hubs are sound. Those at a distance may have the alterations made by sending us the axles and wheels only.

SEND FOR ILLUSTRATED CATALOGUE AND PRICE LIST.

HARNESS for PHYSICIANS' USE.

Please mention this Journal.

TO PHYSICIANS.

A large number of the profession in this and other cities now using the

RUBBER CUSHIONED AXLE,

And in some instances, for more than two years, accord it their unqualified endorsement as a means of obtaining relief from the discomfort and fatigue experienced when riding much, or at long distances.

Muffling noise and **rattle, preventing violent dilation of the springs** whereby **motion is lessened, decreasing vibration, jolting** and **pounding, economizing wear** and **tear** at every point, especially upon the wheels, reducing repair bills fully 50 per cent., renders this

APPROVED INVENTION

of the greatest value to all who would ride with **increased safety, absolute comfort, saving money** at the same time.

The improvement is simple in construction and easily applied. The expense is quite insignificant when compared with the gain, not only in largely increased durability of the vehicle, but in horse-power also, traction being reduced from 17 to 25 per cent.

Should your carriage builder be unfamiliar with the mechanical principle of "the axle," or the manner of its application, please send us his name and address, which will receive prompt attention.

By permission, we refer to the following well-known gentlemen now using the "Rubber Cushioned Axle," and, with two exceptions, for periods exceeding fifteen months:

Dr. Edward Bayard, 8 West 40th Street.
Dr. H. P. Farnham, 138 West 23d Street.
Dr. G. A. Peters, 12 West 29th Street.
Dr. Wm. H. Draper, 4 East 37th Street.
Dr. S. D. Powell, 76 West 55th Street.
Dr. L. H. Sayre, 285 Fifth Avenue.
Dr. J. L. Campbell, 259 West 42d Street.
Dr. Chas. A. Leale, 239 West 53d Street.
Dr. J. S. Bassett, 11 West 31st Street.
Dr. O. Füllgraff, 53 Irving Place.
Dr. G. E. Belcher, 43 East 21st Street.
Dr. Robt. Watts, 49 West 36th Street.
Dr. Edwards Hall, 13 East 66th Street.
Dr. J. W. Warner, 82 Lexington Avenue.
Dr. Francis G. Smith, Jr., University of Pennsylvania, Phila.

MEDICATED DISCS
For Hypodermic Injection.

SPECIAL NOTICE.

Messrs. **SAVORY & MOORE** beg most respectfully to inform the MEDICAL PROFESSION generally, that the great demand which has arisen for their **GELATINE PREPARATIONS**, since they were first introduced, has compelled them to extend their Laboratory in New Bond Street, by the erection of a Department for the exclusive purification and manipulation of these articles. The discs for **HYPODERMIC INJECTIONS**, and for **OPHTHALMIC PURPOSES**, as well as the **LAMELS FOR INTERNAL USE**, will henceforth be prepared under the **immediate supervision of the Firm.** This Special Department is so arranged that the delicate process of manufacturing the Sheets of Gelatine cannot possibly be interfered with, and consequently the **perfect purity** and **accurate dosage** of these important and delicate preparations may be **THOROUGHLY RELIED ON.**

The HYPODERMIC DISCS are now sold in boxes, which have been found to be of greater advantage for their preservation than the leather wallets originally employed.

SAVORY & MOORE, 143 New Bond St., LONDON, ENGLAND.

SAVORY & MOORE

Beg to call the attention of the Profession to some of the Later Preparations brought out in England, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION.

Prepared in accordance with the direction of the Physician who introduced this Pure Drug as

A REMEDY for CONSUMPTION and WASTING DISEASES.

In the above-named diseases, or in cases where there is an unfortunate tendency to these distressing complaints, the introduction of fatty matter into the system, in some manner, is admitted by all Medical Authorities to be an **absolute necessity.** When Cod Liver Oil fails to increase weight, or cannot be tolerated by the stomach, Pancreatic Emulsion is the only remedy which can supply its place, and it may also be given in conjunction with the Oil, as it has the power of digesting it.

PANCREATINE.

An almost tasteless powder, readily taken with water, milk, wine, etc. It possesses the active properties of the Pancreatic Juice, and is an important aid to the digestion and assimilation of starch, albuminoids, and fatty substances, such as Cod Liver Oil.

PEPTODYN, the New Digestive,

Is a combination of the whole of the digestive secretions, forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition. Peptodyn is intended as a general promoter of digestion for persons not necessarily considered in bad health; thus, when taken about a quarter of an hour after a meal, it will be found to assist digestion in a remarkable manner, and prevent the discomfort which often follows the partaking of a full meal by persons in good health.

AS SUPPLIED TO

THE ROYAL NURSERIES,

AND CONTAINING THE

Highest Amount of Nourishment

IN THE

MOST DIGESTIBLE AND CONVENIENT FORM.

This Food resembles Mother's Milk more closely than any other kind, perfectly fulfilling its object—that of promoting the **growth** and **health** of the Child.

DATURA TATULA, for Asthma,

HAY FEVER and **CHRONIC BRONCHITIS.** Recommended by the Profession as a remedy of great power and usefulness in cases of short and difficult breathing, spasmodic coughing, etc. Prepared in Cigarettes, and in the form of Tobacco; also Powder and Pastilles for Inhalation.

SAVORY & MOORE, 143 New Bond Street, LONDON, ENGLAND.

'BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end), *20 cents*
Seven " " " " " *$1.00.*
Crusts, each (Hermetically Sealed), ... *2.00.*

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of information may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free.
A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 33° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

Medical Pictures and Portraits

For PHYSICIANS' OFFICES.

Harvey Demonstrating the Circulation of the Blood

A fine photograph, from a valuable engraving.

Size, 7x9 inches, on fine white mount, 13x16. Price, $1.00
Size, 15x18 " " " 22x26. " 4.00

The engraving of the above is entirely out of print.

THE ANATOMICAL LECTURE.

(After Rembrandt.)

A fine photograph, in both size and price same as Harvey, making a fine companion picture.

THE ANATOMIST.

From a painting by the great artist Max of Germany.

It represents a Professor in deep study, sitting by the side of a female subject of great beauty.

A Fine Etching. Price, $1.00
Or, Proof Copies. " 1.25

JENNER VACCINATING A CHILD

Photograph.

Size, 8½x10 inches, on fine white mount . Price, $1.50.

AMBROISE PARÉ.

To this celebrated French surgeon is attributed the introduction or first use of Ligatures, instead of the old mode by the actual cautery. It represents an operation on the leg of a soldier on the battle-field, surrounded by several eminent men who are looking on with great interest. This engraving, now very scarce and rarely found, has been published in fine Photograph, in three sizes, viz.:

7x9 inches, on white mount, 15x16. Price, $1.50
15x18 " " " 22x28. " 4.00
7x13 " on granite " 11x19. " 2.00

HIPPOCRATES.

A fine photograph from an old and valuable engraving.

Size, 11x14 inches. Price, $1.00.

PHOTOGRAPH PORTRAITS OF

(Imperial Size)

SIR ASTLEY COOPER,
DR. JOHN HUNTER,
DR. RICHARD BRIGHT. } Price, 50 cents each.

THE LUNATIC ASYLUM.

This remarkable picture by KAULBACH, represents a scene in the yard of a Mad-House. A group of unfortunates, each one occupied with the ideas of his own fancy. One as a king, another as a miser, and so on. As a composition and study, it is one of great interest.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

ANDRÈ VESALE.

A picture of this celebrated anatomist, at work in his attic, listening to approaching footsteps.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

Prof. CHAS. A. BUDD.

A photograph from life of the late Prof. C. A. Budd, and the only portrait approved of by himself and family. A fine likeness.

Imperial size, from life. Price, 50 cents.

OTHER PHOTOGRAPHS ARE IN PREPARATION.

Sent by mail, post-paid, on receipt of price.

WM. WOOD & CO., 27 Great Jones Street, New York.

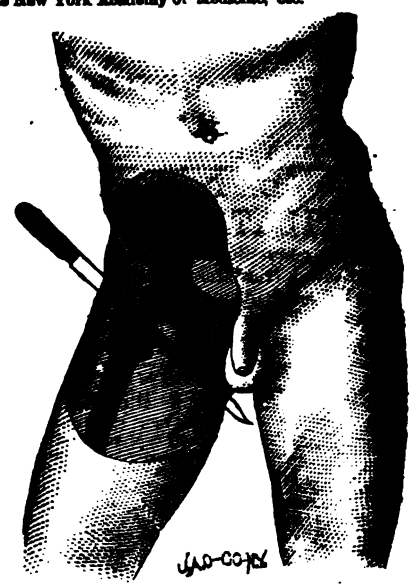
ON SURGERY

THE PRINCIPLES AND PRACTICE.

By FRANK HASTINGS HAMILTON, M.D., LL.D.,

Professor of the practice of Surgery with Operations, and of Clinical Surgery in Bellevue Hospital Medical College; Visiting Surgeon to Bellevue Hospital; Consulting Surgeon to the Bureau of Surgical and Medical Relief for the Out-Door Poor at Bellevue Hospital; to the Central Dispensary, and to the Hospital for the Ruptured and Crippled; Fellow of the New York Academy of Medicine, etc.

In one royal octavo volume of about 1,000 pages, illustrated by 467 Engravings on wood.
Price, in extra muslin, $7.00; or in leather, $8.00.



Anatomy of Hip Joint, and Guides for the Knife.

NOTICES OF THE PRESS.

"Has evidently been prepared with the greatest care, both on the part of the author and his publishers; and as a text-book for the students, it reflects the highest credit upon its well-known and gifted writer. As a text-book for the student, or one of reference for the busy practitioner, it undoubtedly is one of the best and *most modern* that has yet appeared."—*The Medical Record.*

"A valuable addition to our list of text-books, an excellent work of reference, a credit to our professional literature."—*New York Medical Journal.*

"It will be found an excellent and common-sense volume."—*London Medical Times and Gazette.*

"This is one of the best text-books upon Surgery which we have ever seen, and we recommend it highly to the profession."—*Chicago Medical Examiner.*

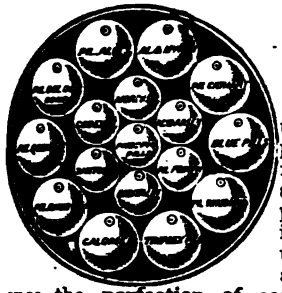
"Prof. Hamilton's latest work is one that will add to his already high reputation. . . . It is full of valuable practical suggestions and directions."—*Am. Journal of Medical Science.*

"American in plan, scientific in method, written in clear, concise, classical English, Prof. Hamilton's Surgery is a noble legacy to the medical student, an honor to the profession, and an ornament to our native tongue."—*Detroit Review of Medicine.*

Sent by mail postpaid on receipt of price.

WILLIAM WOOD & CO., Publishers, 27 Great Jones St., New York.

Printed Pills and Granules



These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the perfection of accuracy, and a safeguard against mistakes or substitution. Their claim to the confidence of the medical profession and pharmacists rests on the entire purity of the ingredients used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal:

Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

SOLE AGENTS FOR THE UNITED STATES.

LAZELL, MARSH & GARDINER'S, POWDERED MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts*.

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

FOOD IS THE BEST TONIC!!

TRADE MARK.

MENSMAN'S

PEPTONIZED

BEEF TONIC.

The great necessity for a fluid food that would possess all the elements necessary for the support of the system, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared for us by reliable and competant parties after a thoroughly tested and scientific method.

PROPRIETORS,

CASWELL, HAZARD & CO.,

DRUGGISTS AND CHEMISTS,

PARVULES.

MINIMUM DOSES FOR CHILDREN AND OTHERS.

At the solicitation of our medical friends we have prepared this new class of preparations, denominated PARVULES to distinguish them from Pills and Granules. They are designed for the administration of medicines in minute doses for children, and for frequent repetition in case of adults. It is claimed by some practitioners that small doses given at short intervals exert a more curative effect.

☞ THESE ARE NOT INTENDED TO SUPPLANT THE USE OF PILLS AND GRANULES. ☜

FOR SALE BY DEALERS, GROCERS AND DRUGGISTS.

Pullna Bitterwater.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of convalescence. According to the most minute analysis by Herzel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallised state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromids of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

PRICE.—Case of 20 Pint Jugs.....$3.25 by
Case of 50 Pint Jugs..... 8.00 "
Less discount according to quantity.

NATURAL

Mineral Water,

THE QUEEN OF TABLE WATERS,

HIGHLY EFFERVESCENT.

DR. LEWIS A. SAYRE. "A delightful beverage—Great relief for sea-sickness."

DR. WILLIAM A. HAMMOND. "Far superior to Vichy, Seltzer, or any other."

DR. ALFRED L. LOOMIS. "Most grateful and refreshing."

DR. R. OGDEN DOREMUS. "Absolutely pure and wholesome; superior to all for daily use; free from all the objections urged against Oroton and artificially-aerated waters."

PROF. WANKLYN, London, Eng. "Impregnated only with its own gas."

DR. E. R. PEASLEE. "Useful and very agreeable."

DR. AUSTIN FLINT. "Healthful, and well suited for Dyspepsia, and cases of acute disease."

DR. JAMES R. WOOD. "Mildly antacid; agrees well with dyspeptics, and where there is a gouty diathesis."

DR. FORDYCE BARKER. "By far the most agreeable, alone or mixed with wine, useful in Catarrhs of Stomach or Bladder and in Gout."

DR. J. MARION SIMS. "Not only a luxury, but a necessity."

To be had of all Wine Merchants, Grocers, Druggists and Mineral Water Dealers throughout the United States, and wholesale of

FRED'K DE BARY & CO.,

41 & 43 WARREN STREET, NEW YORK.

WARBURG'S TINCTURE.

Made from the original recipe of Dr. Warburg and used as a specific in malarious fevers and all diseases arising from malaria. This preparation is recommended by the English Government, and extensively used in all the English military hospitals, particularly in the East Indies. (see London *Lancet*, Nov. 13, 1875.)

Please specify, in ordering from any wholesale house, Warburg's Tincture, made by F. A. REICHARDT.

Price per bottle, 1 oz., 75c.; per doz., $5.00. Per pint, $5.00; per doz., $50.00.

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynecologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. $1.00 per dozen, sent by mail. Orders executed by return of mail.

P. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ½ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. 90c. per dozen; $10.00 per gross.

F. A. REICHARDT, Pharmacist,

SEABURY & JOHNSON,

Originators and Manufacturers of

U. S. PHARMACOPŒIA MEDICINAL AND SURGICAL

Plasters POROUS AND SPREAD in Rubber Combination

NEW YORK AND LONDON.

Received highest and only Award (Medal and Special Diploma of Merit) over all Foreign and Home Competitors in 1876.

THE JURORS' AWARD IS SUBSTANTIALLY.

ORIGINALITY.—The successful application of Rubber as a base for all medicinal and mechanical plasters.

RELIABILITY and general excellence of manufactures.

FACTS CONCERNING MEDICINAL PLASTERS IN RUBBER COMBINATION.

Indiarubber-spread and Porous Plasters possess indisputable advantages over all other Plasters: (1) The Rubber Combination preserves the incorporated drug or extract from decomposition or volatilisation; (2) They adhere closer and firmer; (3) They do not soil the skin or linen; (4) They are always pliable, and never become hard or brittle; (5) They adhere without heat or moisture; (6) An increased effect is obtained by being porous, as the Plaster neither slides nor moves from its affixed position.

BELLADONNA PLASTER, U. S. P.

IN RUBBER COMBINATION.

Messrs. SEABURY & JOHNSON claim that theirs is the most thoroughly reliable and only strictly officinal Belladonna Plaster ever offered the medical profession. It is an improvement on other Belladonna Plasters in several important particulars. First, it is incorporated with the officinal alcoholic extract only. Secondly, it is freed from all stimulating qualities, thereby insuring the uninfluenced sedative action of Belladonna. Thirdly, it adheres with greater tenacity than others. Physicians have been prejudiced in favor of Allen's English Extract; but recent analysis, fairly conducted by competent chemists, emphatically condemns the Inspissated Extract as a mild and unstable product, representing but one-half or less than one-half of the strength of the U. S. P. Alcoholic Extract of Belladonna. The following result, published in the *American Journal of Pharmacy*, in April, 1876, page 145 is furnished for your consideration, which indicates the following percentage of Atropia in the respective extracts:

Alcoholic Extract Belladonna, U. S. P.	*2,571*
Allen's English Extract.	*1,411*
Herring's English Extract.	*1,179*

The practitioner, as well as ourselves, has but one choice.

Considering these features from a professional standpoint, we offer a Belladona Plaster which cannot be improved upon.

SALICYLATED SURGEONS' RUBBER ADHESIVE PLASTER.

This article has met with unprecedented success, and has been emphatically pronounced by our most skilful General and Orthopædic Surgeons, as "the best Surgeons' Adhesive Plaster known". It is applied without heat or moisture, conforms quickly to the parts; is perfectly flexible and waterproof, and is ready for use at any moment. It is free from irritating properties and very healing. In counter-extension it has no equal, as it does not move or slide after being applied. Our India Rubber Adhesive Plaster is also spread on twilled linen, which resists the most powerful strain. In addition to these general improvements, the plaster being impervious to water, wounds can be cleansed without removing the plaster, obviating the necessity of constant redressing, saving labor and time. **Whenever continued powerful adhesion is required, it should be procured in porous form.**

MUSTARD PLASTER (spread on Cotton Cloth).

Our Mustard Plaster is a decided improvement over the best French makes; the mustard is manipulated so as to exclude all the moisture, retaining unimpaired by such treatment its essential properties. They are always reliable, conform quickly to the part, and when thoroughly wet do not break into pieces, as is the case with all other mustard plasters. They do not crack or peel off, and can be removed without soiling the skin or linen. Being **manufactured only of pure mustard,** they are perfectly free from Croton Oil or other dangerous substitutes, often employed to induce intense irritation.

RUBBER BLISTER PLASTER (Camphorated) B. P. STRENGTH.

This article has a splendid reputation; its characteristic action is not impaired by age in any climate. The whole fly is incorporated, which by constant manipulation is thoroughly and beautifully combined with the plaster. **Its properties are developed quicker, and its blisters in less time than the cerate.** It never fails to blister when used as directed. In addition to its superior efficacy as a vesicant, we incorporate a sufficient quantity of Camphor, which, with the Olive Oil, used on the face of the plaster, **prevents Strangury.** This improvement will be appreciated by every practitioner. It is more reliable than any known cantharidal preparation.

CAPSICUM PLASTER.

Recently this article has crept into favor with our most esteemed physicians, and judging from results it is doubtless the best rubefacient known. It has the specific action of mustard without its objections. The characteristic action of Capsicum is uniformly maintained from twenty-four to forty-eight hours, without blistering, being mild, continuous, and stimulating. This plaster is spread in rubber combination and in porous form. Experience has taught practitioners that the Oleo Resin of Capsicum is too violent, frequently vesicating; we incorporate the crude drug in sufficient quantity, without risk to the patient. Our Capsicum Plasters will be found more practical for general use than the **so-called Mustard or Capsicum Papers.**

SPECIAL NOTICE TO PHYSICIANS.

Quality is of great importance to the practitioner: by reliable preparations he supplements his own skill. You can therefore rest assured that every article we manufacture is of strict pharmacopœia strength, and incorporated with perfectly reliable Extracts and Drugs, well selected, carefully and conscientiously prepared, and manufactured invariably under the personal superintendence of one of our firm. **Our whole attention and study is devoted entirely to the art of Plaster making,** and we are ready at all times to receive suggestions from the fraternity, which may be of benefit to all.

SEABURY & JOHNSON,

MEDICAL DEPARTMENT OF
HARVARD UNIVERSITY,
BOSTON, MASS.

NINETY-FOURTH ANNUAL ANNOUNCEMENT. (1877-78.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 27th, 1877, and ends the last Wednesday in June, 1878. Persons who hold no degree in arts or science must hereafter pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 24th.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing
DR. R. H. FITZ, Secretary, 108 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF
YALE COLLEGE.

Spring Term begins March 1, and closes June 28, 1877.

Winter Term begins October 4, 1877; closes January 31, 1878.

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address
CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing
H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar.
WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1877, and continue twenty-one weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

THE BOSTON

MEDICAL AND SURGICAL JOURNAL

ESTABLISHED 1828.—PUBLISHED WEEKLY.

THE Publishers of THE BOSTON MEDICAL AND SURGICAL JOURNAL wish to call the attention of physicians to certain special features of this journal which make it exceptionally valuable as a medical periodical, and which commend it to the favor of professional gentlemen throughout the United States.

1. It is a weekly publication, thus possessing obvious advantages for the prompt presentation of medical intelligence, a great part of whose value lies in its freshness.

2. Being the only medical publication in New England, it possesses unusual opportunities for obtaining contributions to its pages, and is able to combine the special advantages of both a weekly and a monthly journal.

3. It contains *nothing* but original material. There are no borrowed articles, the current literature of the day being represented, in a manner peculiar to this journal, by a series of reports by experts in special departments of medical science, who give comprehensive and critical summaries of the most recent advances in their respective branches, and who constitute undoubtedly the strongest corps of the kind in the country.

4. It gives special attention to the department of reviews, which are fuller and more carefully prepared than in most medical journals.

5. Reports are received from a large number of medical societies, representing all departments of medicine. The facilities for obtaining clinical contributions from hospital practice have been greatly enlarged, embracing the most important hospitals of New England.

6. The correspondents' department has been organized with great care, and the chief medical centres of the world are here represented. A letter from one of these places appears in each issue of the JOURNAL.

7. A weekly table, showing the comparative mortality rates for the week, of thirteen large cities in the United States.

8. Editorially the JOURNAL aims to represent the profession of the whole country. It is one of the pioneers of medical science in the country, being, with one exception, the oldest now in existence. It was originated and has been maintained by no school or interest whatever beyond that of the science and practice of medicine and the medical profession.

The Editors and Publishers will spare no pains to keep the JOURNAL in the high and honorable position which it has so long occupied among American medical periodicals.

EDITOR.—DR. J. COLLINS WARREN.

EDITORIAL STAFF.—DR. A. D. MASON, DR. C. F. FOLSOM, DR. GEORGE B. SHATTUCK.

EDITORIAL REPORTERS.—DR. G. W. GAY, DR. F. W. GOSS, DR. HAMILTON OSGOOD.

DR. H. P. QUINCY, ANATOMICAL DRAUGHTSMAN.

THE REPORTERS ON MEDICAL PROGRESS in Anatomy, Chemistry, Dentistry, Dermatology, Diseases of Children, Diseases of the Throat and Chest, Electro-Therapeutics, Gynæcology, Materia Medica, Mental Diseases, Military Surgery, Obstetrics, Ophthalmology, Orthopedic Surgery, Otology, Pathology, Physiology, Public Hygiene and Forensic Medicine, Surgery, Syphilis, Theory and Practice of Medicine, and Genito-Urinary Surgery, comprise the principal Professors in the Medical School of Harvard University, and the leading Physicians and Surgeons in the Massachusetts General Hospital, Boston City Hospital, and Boston Lying-in Hospital.

TERMS.—*Five dollars a year*, payable in advance; single numbers *fifteen cents*. *Postage in all cases is paid by the Publishers.* Remittances may be made by draft, money-order, or registered letter to H. O. HOUGHTON & Co., *Riverside Press, Cambridge, Mass.*

A Compend of Diagnosis in Pathological Anatomy

With Directions for Making Post Mortem Examinations. By DR. JOHANNES ORTH. Translated by G. K. SABINE, M.D., and F. C. SHATTUCK, M.D. Revised by R. H. FITZ, M.D. In one volume, 8vo, cloth, $3.50.

In issuing a translation of this recent German work, the publishers have been convinced of its great practical value to all medical students. The directions for making an autopsy are given with great thoroughness and precision; the means of recognising the various changes which may be found on the different parts of the body are briefly stated in a systematic manner, and the medico-legal bearing of the results of the investigation are always carefully attended to. The description of the gross appearances is also supplemented by thoroughly practical directions in the use of the microscope, when important additional information becomes necessary for exact diagnosis.

Dr. Orth was formerly the assistant of Professor Rindfleisch, and at present holds a like position under Professor Virchow. The teaching which he offers is consequently that of the highest authorities in the very centre of modern investigation in this department of medicine.

The Publishers are the more desirous of calling attention to the translation, as it contains, through the kindness of the author, much additional information and corrections as he has prepared for the second edition of the original work, hereafter to be published. They have received many letters from prominent physicians and surgeons, warmly commending the book, and among them the following:

COLLEGE OF MEDICINE, SYRACUSE UNIVERSITY,
SYRACUSE, N. Y., *December* 5, 1877.

Every physician should carefully read the admirable work of Prof. Orth on "Diagnosis in Pathological Anatomy." For this book teaches—what so few know—how to make a neat *sectio cadaveris*. Prepared by a pupil of Virchow, the greatest pathologist in the world, it is not only fascinating, but authoritative on all points which it discusses. Cleverly translated, the book is one of the best additions to the best recent medical literature. I thank you for the copy sent me. I heartily commend it to my classes, and to my professional brethren here and everywhere.

H. D. DIDAMA.

PHILADELPHIA, *December* 7, 1877.

I have delayed the acknowledgment of the handsome translation of Orth's "Diagnosis in Pathological Anatomy," which you so kindly sent me, until I had time to read it carefully. Its clear and brief, but comprehensive, descriptions of the downright facts of pathology are almost unsurpassed, and although I am at present teaching normal histology, I shall have and use many opportunities of recommending this work to our students.

JOS. G. RICHARDSON.

TO PHYSICIANS.
THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, i. e., the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been prohibited from the enjoyment and health-giving results of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

OF

SURGICAL

AND

ORTHOPEDICAL

INSTRUMENTS,

Anatomical Preparations,

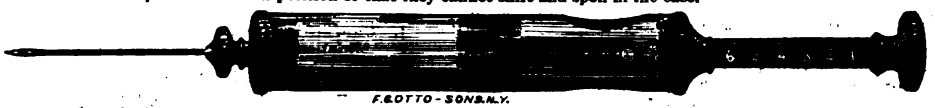
SKELETONS, &c.

Trusses, Abdominal Supporters, Elastic Stockings, &c., &c.

No instrument is used as often as the Hypodermic Syringe, and consequently they frequently get out of order. To furnish to the profession an instrument which can easily be kept in good working order, and which can be easily repaired, is our object of describing the following:

The instrument has two cannulas of steel, either gilt or nickel-plated; will not oxidise; they are tempered, and have an easily-introduced lance-shaped point, which can be easily sharpened. The diameter of the canula is ½ mm.

The Syringe is contained in a neat Hard Rubber case, the lower part of which holds the Syringe, and a vial of 5 grammes' capacity. The needles are placed in the cover, and are held in position so that they cannot shift and spoil in the case.



The advantages these Syringes possess over others may be briefly summoned as follows:

The construction of the cylinder out of hard rubber or glass, and the simple manner in which the different parts can be attached to another.

The construction of the stopple and the method of filling.

The manner in which the canulas are held in the case.

Dr. GAILLARD T. THOMAS, after examining the above instrument, pronounced the same to be one of the best improvements made in instruments since years.

Dr. G. R. PATTON, Lake City, Minn., writes: The Hypodermic Syringe came while I was away; I am pleased with it beyond expression.

PRICES.

The syringe with glass cylinder	$5 00
The syringe with glass cylinder, in a nickel-plated case, without a vial; very compact	3 50

An increase of 200 pages additional Reading Matter in a year will be made in

THE AMERICAN JOURNAL OF OBSTETRICS

And Diseases of Women and Children.

PAUL F. MUNDÉ, M.D., Editor.

In consequence of the great increase in the number of Subscribers to the AMERICAN JOURNAL OF OBSTETRICS the past year or two, the Publishers take pleasure in announcing that, beginning with January, 1878 (Vol. XI., No. 1.), they will permanently increase each number by *fifty additional pages*, thus giving its subscribers annually about

ONE-THIRD MORE READING MATTER

than heretofore, or, a volume of 896 large octavo pages with *no change in the subscription price.*

An increased number of illustrations, both wood engravings and lithographed plates, may also be expected in future volumes.

While the prosperity of the AMERICAN JOURNAL OF OBSTETRICS, and this consequent substantial evidence of it, cannot fail to be gratifying to all its subscribers and other friends, the Publishers trust the Medical Profession will take this voluntary action on their part as an earnest of their desire and intention, so far as in their power, to make all their publications merit the liberal support which is given them.

Subscription Price, $5.00 per year, invariably in advance.

☞ If any subscriber has a friend to whose notice he would like to commend the Journal, the Publishers will be pleased to mail a Specimen Copy to any address furnished them.

CONTENTS OF JANUARY NUMBER AMERICAN JOURNAL OF OBSTETRICS.

ORIGINAL COMMUNICATIONS.

I.—Remarks on the Obstetric Forceps, with a Description and Demonstration of Tarnier's New Instrument. By FORDYCE BARKER, M.D.

TOTAL ABSTINENCE SAVING WINE TILL IT RIPENS.

There is a curious story about some native wines which are extensively advertised nowadays, and have only recently been put upon the market. Dr. Underhill, the well-known grape-grower of Croton Point, died in 1871. Some of his heirs entertained temperance views of such extreme kind, that they were unwilling to allow the stock of wines then on hand to be sold or any more to be made. The grapes have sometimes been sent to market, and sometimes left to decay upon the vines. It is only now that the other heirs have succeeded in arranging for a settlement of the estate and the sale of the wines on hand. Among these is a wine of the vintage of 1864, described as a "Sweet Union Port," but suggesting the Imperial Tokay more than any other European wine, and being wholly unlike any other wine of American growth. Its purity, age and mellowness are remarkable, and both physicians and wine-fanciers have a special interest in it as the oldest native wine now accessible in any considerable quantity. The whole stock is in the hands of the well-known wholesale grocery house of the Thurbers.—*N. Y. Tribune, Nov* 19, 1877.

The above speaks for itself; but we would add that this is the pure juice of the grape, neither *drugged, liquored* nor *watered;* that it has been ripened and mellowed by age, and for medicinal or sacramental purposes, it is unsurpassed. It can be obtained from most of the leading Druggists throughout the United States, and at wholesale from the undersigned, who will forward descriptive pamphlet, free of charge, on application.

Respectfully, etc.,

H. K. & F. B. THURBER & CO.,

West Broadway, Reade and Hudson Sts.,

NEW YORK.

BELLEVUE HOSPITAL
MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMITH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

Messrs. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

THE MANUFACTURERS,

KEASBEY & MATTISON,

332 N. Front Street, Philadelphia.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

WARNER & CO.'S
SUGAR-COATED QUININE PILLS.

(With Twenty-Six Combinations.—See List.)

QUININE PILLS of our make are prepared from *Sulphate of Quinia* of American manufactur, noted for its purity and excellence. Each Pill contains the full complement of material as expressed on the label, without the necessity of adding any excess to compensate for impurities. They are perfectly soluble, and physicians can depend upon getting the full benefit of this valuable remedy in a pleasant form.

SUGAR-COATING, properly applied, does not impair the quality of such medicines as are commonly thus enclosed. *Dr. W. S. Edgar, Editor, says:*—"We procured a variety of W. R. WARNER & Co.'s preparations, and have prescribed them as opportunity offered, with *satisfactory evidence of their purity*, and reliability as to the quantity in each dose; also, we extract the following paragraph from a letter by a competent analytical chemist:"—

SUGAR-COATED QUININE PILLS.

"I take pleasure in testifying that W. R. WARNER & Co.'s QUININE PILLS are practically just what they claim to be, whether judged by analytical tests or by the therapeutic effect obtained from their use.

DETROIT, MICH. "A. B. LYONS, M.D., *Analytical Chemist.*"

WILLIAM R. WARNER & CO., Manufacturers of Sugar-Coated Pills,
1228 Market Street, Philadelphia.

SCOTT'S EMULSION
PURE COD LIVER OIL
WITH
HYPOPHOSPHITES OF LIME AND SODA
PERFECT, PERMANENT, PALATABLE.

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

Original Lectures.

DISEASES OF THE NERVOUS SYSTEM.

A Lecture Delivered at Bellevue Hospital Medical College, November 30, 1877.

By C. E. BROWN-SÉQUARD, M.D.

[Reported for The Medical Record.]

SYMPTOMS INDICATING DISEASE AT THE BASE OF THE BRAIN, CONTINUED—SYMPTOMS ACCOMPANYING DISEASE AT THE LOWER AND AT THE UPPER PART OF THE PONS VAROLII—NYSTAGMUS—CONJUGATE DEVIATION OF THE EYES AND NECK—TWO IMPORTANT SERIES OF FACTS WHICH SHOW THE FALSITY OF THE GENERALLY ACCEPTED DOCTRINE REGARDING THE PHYSIOLOGY OF THE NERVOUS SYSTEM—ABSENCE OF DECUSSATION OF VOLUNTARY MOTOR FIBRES AT THE BASE OF THE BRAIN—HEMIPLEGIA DUE TO DISEASE IN THE CEREBELLUM, ETC.—SYMPTOMS, SUCH AS GENERAL WEAKNESS, AMAUROSIS, HEADACHE, VOMITING, PECULIAR DISORDER OF MOVEMENT, ETC.

Gentlemen:—You will remember that a fortnight ago I examined with you certain questions relating to the modes of diagnosis between cases of disease in the base of the brain and cases of disease in other parts of the brain. I said that it was sometimes very difficult to diagnose paralysis caused by disease in the base of the brain from paralysis caused by disease in other parts of the brain, but I mentioned a good many facts which tend to show that, in a large number of cases, at least, we can determine where the cause of the paralysis is situated. There are a few symptoms which I did not mention, as I was unable at that time to make the subject absolutely complete, and to those I will now direct your attention.

SYMPTOMS OF DISEASE IN THE PONS VAROLII.

When there is paralysis of one side of the body, caused by disease in the pons varolii, if there is facial paralysis—and there is almost always—it exists upon the side of the face opposite to the paralysis in the body. This is true in most cases; the facial paralysis, however, may exist upon the side corresponding with the paralysis in the limbs.

If the seat of the disease is low down in the pons, near to the medulla oblongata, if it affects the roots of the facial nerve, then there will be facial paralysis upon the side corresponding with the disease, and paralysis of the body upon the opposite side. But if the disease be in the upper part of the pons varolii, the symptoms are different, and in most cases the paralysis exists both in the face and in the limbs upon the side opposite to that on which the disease exists. But there is one very important feature. If you look at a patient who has been attacked with brain disease, you may notice that a kind of paralysis is present which consists in an inability to close the eye; the orbicularis palpebrarum is paralyzed, and this form of paralysis occurs almost exclusively in cases of disease in the pons varolii. This muscle is not found paralyzed, except very exceptionally, in cases in which the disease exists elsewhere than in the pons varolii. If you direct the patient to close the eye, in case the disease exists in the lower part of the pons varolii, you will find that he is unable to do so. There is, therefore, in that symptom a characteristic condition which in almost all cases shows that the disease is either in the pons varolii or near there. If the orbicularis palpebrarum is paralyzed, and the side of the face is also paralyzed, and the limbs are paralyzed upon the opposite side of the body, there is almost a certainty of the existence of disease in the lower part of the pons varolii. As you will see in the last lecture of this course, this is an important fact to recognize, because the treatment of disease in the pons varolii is not the same as treatment of disease in other parts of the brain. This peculiar feature is well worth remembering, as it is quite characteristic.

NYSTAGMUS.

There are other symptoms which show that the disease is in the pons varolii, or in the medulla oblongata, or in both. One of these is very striking, and is called *nystagmus;* it consists of an involuntary spasmodic oscillation of the eyeball. What this trembling of the eyes produces with reference to the gait of the patient you can readily understand.

CONJUGATE DEVIATION OF THE EYES AND NECK.

Another feature of interest consists in a symptom which has been studied only within the last fifteen or twenty years, and more particularly by Vulpian and his pupil at Geneva. This symptom consists of a deviation of the eyes and of the neck. If I look towards my left shoulder you will observe that both my eyes and my neck are turned in that direction, and you have an illustration of what has been called conjugate deviation of the eyes and neck. This is a very frequent symptom indeed of softening of the brain. It is also a frequent symptom in cases of hemorrhage in the brain.

There is another peculiarity about this symptom. In cases of disease elsewhere than in the pons varolii, the tendency of the eyes and the neck to turn towards one shoulder shows itself, but it is towards the side where the injury exists in the brain; whereas, if the disease is in the pons varolii, the deviation of the eyes and neck is very generally towards the paralyzed side of the body, and not towards the seat of injury. This symptom may be present with disease in any part of the brain: it comes in fact as convulsions do, in connection with any disease or injury of the brain. The symptom consists of a spasmodic or convulsive movement of the muscles of the eyes and the neck, and the deviation in most cases is towards the left when the disease is in the left side of the brain, and towards the right when the disease is in the right side of the brain, and not towards the side of the body which is paralyzed. In cases of disease of the pons varolii, however, it is not infrequently just the reverse, and the deviation will be towards the paralyzed side and not towards the side of the pons which is injured. Here again we have a means of diagnosis between disease in the pons varolii and disease in other parts of the brain.

Still, there are a number of cases in which the deviation has taken place in the wrong direction to agree with the statements which I have just made; that is, there are cases in which disease in any part of the brain, instead of producing deviation towards the side injured, has produced deviation towards the opposite side, and *vice versa*. In most cases, however, the rule mentioned will hold good.

TWO IMPORTANT SERIES OF FACTS.

Before passing to the study of other parts of the nervous system, I have to say two things which I regard as very important, and hope you will remem-

ber. For by these two series of facts the generally accepted doctrine of the physiology and physio-pathology of the nervous system are shown to be false, and it is especially for this reason that I ask you to do me the favor to write them down in your memory.

First.—There are many cases upon record in which the pons varolii or the medulla oblongata have been in a great measure altered in structure without the production of marked paralysis. You remember that I have often said a few fibres of communication existing between the upper portion of the brain and the spinal cord may be perfectly sufficient for the persistence of almost all voluntary movements. If this is so, the facts are very simple which I will now mention. You can easily understand if a few fibres—a few compared to the immense number—are sufficient to establish a communication between the brain and the spinal cord, how it is that extensive disease in these parts may occur without producing marked paralysis. You can easily understand how, in a case like Stanley's, in which a sailor was able to perform his duties up to within a few weeks before his death, and who died of another disease than that of the brain, this might occur without marked paralysis, although the medulla oblongata was reduced to one-fifth its normal size by pressure at the foramen magnum produced by an exostosis. Notwithstanding this pressure upon the medulla, the sailor performed all the duties which his calling required, with force and agility. He died of a disease entirely distinct from this brain affection, and there was no marked paralysis in his case at any time, if any paralysis at all. There are many other cases upon record which have nearly the same strength as the one reported by Stanley.

Indeed, there are many cases in which the odontoid process has become extremely large, and so pressed upon the medulla oblongata as to render it extremely small; what remained of the medulla certainly could not have been perfectly healthy, and yet no marked paralysis was developed.

There are many other cases in which tumors have produced marked alteration in the medulla without giving rise to marked paralysis. There is one case on record in which it is said that the medulla oblongata, when cut into, gave a noise like cutting into hard cheese, so extensive was the change in structure; and yet no marked paralysis existed. In some cases the structure of the medulla oblongata has been so changed that not a single fibre has remained unaffected.

So there are many cases—a great many indeed—in which these parts have been deeply altered without producing any marked paralysis. I purposely use the term marked paralysis, although the writers said there was no paralysis at all. But as I know that examination of the strength of the patient has not been done with sufficient care until quite recently, I allow for that, and instead of saying there was no paralysis, I say there was no considerable or marked paralysis. These facts may seem very strange to those among you who remember that these two portions of the nervous centre—the pons varolii and the medulla oblongata—are those which are the most delicate, and those upon which, if a sudden injury be inflicted, it almost always proves fatal, and proves fatal rapidly.

Indeed, a mere prick with a needle in the medulla of an ox will kill the animal immediately; and such is a favorite method of killing bullocks in Spain. A mere prick made at the lower part of the medulla oblongata almost always causes death at once. But although death is caused so easily in this manner, lesions which are not so rapid, or which occur at some distance from the lowest part of the medulla oblongata, can gradually, and sometimes rapidly, alter the tissues without producing marked symptoms. There are cases on record in which hemorrhage has taken place into the pons varolii without producing marked paralysis. My former assistant, Dr. J. Hughlings Jackson, has seen one of these cases. There is no contradiction between the two series of facts: (1) that death may be produced suddenly from rapid and sudden injury of the medulla oblongata in its lower part; and (2) that disease slowly developed, or if developed at some distance from the "focus of life,"—the gray matter at the nib of the calamus—may not give rise to marked paralysis.

The *second* point, relating to the base of the brain, to which I wish to draw your special attention, is also most important. It is most important, for it establishes my views regarding the origin of paralysis and convulsions, or at least proves that the old views must be laid aside; certainly the old views are in opposition to thousands and thousands of facts.

What I have to say clearly shows that there cannot be any decussation of voluntary motor fibres at the base of the brain, such as is most essential for the maintaining of the old theories regarding the production of paralysis. You already know that what is taught in your books, and by nearly every man who teaches medicine, consists in admitting that paralysis appears on the opposite side of the body from the side where the disease which caused it exists in the brain; and that it appears so because of a pretended decussation in the middle line, either in the pons varolii or in the medulla oblongata, or in both, of voluntary motor fibres, which go from the right side of the brain to the left side of the body, and from the left side of the brain to the right side of the body.

It is very easy to show from a large number of facts that we cannot admit that voluntary motor fibres cross each other in the pons varolii; and it is also easy to prove that such decussation does not occur in the medulla oblongata. If I show that there is no part in the base of the brain in which decussation of voluntary motor fibres can be expected to take place, of course we are obliged to admit that there is no such decussation of voluntary motor fibres.

You already know that the bands of union between the brain and the spinal cord are the crura cerebri, the pons varolii, and the medulla oblongata.

The cerebellum has never been regarded as a centre from which voluntary motor conductors pass to the spinal cord. Indeed, it would be absurd to suppose that there can be through the cerebellum such a communication, because destruction of that organ a great many times by disease has proved absolutely that it is impossible for disease of the cerebellum to produce paralysis. There certainly is no one who admits that the cerebellum is a channel of communication between the brain and the spinal cord.

The only possible channels of communication, then, are the crura cerebri, the pons varolii, and the medulla oblongata. The question then which is decisive as regards the theory of the cause of paralysis is, is there or is there not any decussation of voluntary motor fibres in any of these parts? I will now take the facts as they exist.

Suppose there is disease in the pons varolii destroying one-half of that organ. In most of these cases, not in all, there has been paralysis upon the opposite side of the body, and only there. There has been no paralysis at all upon the corresponding side in most of these cases, while the paralysis was absolute in the limbs upon the opposite side. What conclusion do

we draw from this? It seems clear from this fact that fibres which serve for the production of voluntary movements upon the opposite side of the body, pass across there, as we find complete paralysis upon the opposite side.

If you admit this conclusion, you must also admit that the decussation which takes place in the pons varolii does not include all the voluntary motor fibres; for if they all cross at that point, lesion in either half of the pons would destroy the voluntary motor fibres going to both sides of the body, and there would be paralysis of both sides of the body, and not paralysis of the opposite only, as occurs in most cases. The fibres which come from the side in which the disease exists are destroyed, and the fibres coming from the opposite side are also destroyed; so if these were all the fibres which serve as conductors of voluntary motor action, there would be complete paralysis of both sides of the body. We see, however, that paralysis occurs only upon the opposite side of the body, or upon the corresponding side with the disease. We must then, as also does Schiff and many others, reject the view that the voluntary motor fibres make their decussation in the pons varolii, and there only. The fibres which decussate in the medulla oblongata are, as you well know, extremely numerous. These fibres go through the pons varolii.

For a long time I believed that decussation of the voluntary motor fibres took place only in the medulla oblongata, and I published a paper with the view of establishing that doctrine. In after-time facts came which seemed to give strength to what I had stated. We know that when there is disease in one-half of the pons varolii, or in the crura cerebri, or in other parts of the brain, there is frequently degeneration of the fibres all along the crura cerebri, then in the pons varolii and the anterior pyramid upon the same side, and so the theory seeemed to be complete. But now I think it can be proved absolutely that decussation does not take place in the medulla oblongata alone. If this is done it will be shown clearly that the decussation in the pons varolii is not that which is employed in the transmission of the power of the will from one side of the brain to the other side of the body; it will be shown that we must reject the view that voluntary motor fibres decussate in the brain at all. What are the facts? There are many cases of disease of either part of the spinal cord upon one side without any paralysis whatever.

The corpus restiformis, or anterior pyramid upon one side, can be destroyed without producing any marked paralysis upon the opposite side of the body. Still more, experiments upon animals, as already stated, have shown that the anterior pyramids can be divided without producing paralysis. After section of one-half of the medulla oblongata, you may see paralysis upon the corresponding side just as frequently as upon the opposite side of the body. There are some physiologists who maintain that paralysis in such cases is always upon the same side. I have seen the paralysis incomplete on one side, incomplete on the other, and complete on both sides. If we find that disease can destroy one anterior pyramid without producing paralysis; furthermore, if we find that disease can destroy both anterior pyramids without producing paralysis, as in the case reported by Prof. Vulpian, in which no trace of paralysis appeared, the woman walking into the wards of the hospital two or three days before her death, and giving no other indication of serious disease of the brain—when we see such facts, and then find at autopsy that almost all the fibres of the anterior pyramids are destroyed, or at all events atrophied, it is clear that we are not to look to the medulla oblongata as the place where decussation of voluntary motor fibres takes place. If you put these two series of facts together—those relating to the pons varolii and those relating to the medulla oblongata—you will find that the voluntary motor fibres cannot be decussated in the pons varolii or in the medulla oblongata, and, as there is no other place where decussation can occur, the conclusion must be that, if there are fibres in those parts which decussate, they are not voluntary motor fibres. This is the conclusion to which I wish to lead you. The result is that paralysis, which we know to be almost always upon the side of the body opposite to the seat of the disease in the brain, cannot depend, as it is claimed, upon destruction of voluntary motor conductors. If there is no decussation, you can easily understand it is not because there are such decussating fibres that there is paralysis.

The same conclusion can be reached not only from an examination of facts relating to paralysis, but also from an examination of facts relating to convulsions. Convulsion, which is another form of muscular contraction due to involuntary muscular action; rigidity of the muscles, as well as choreic movements, trembling, catalepsy, etc., all these forms of disordered movements may appear upon the side of the body corresponding with the seat of the disease in the brain. You will find that there are many cases in which disease has existed upon the pretended motor conductors in the pons varolii, the medulla oblongata, and the crura cerebri, with convulsions upon the same side of the body. If the fibres which exist in those parts are the fibres which move the muscles upon the opposite side of the body, you would, as a result of destruction of those fibres, always, always, always have convulsions upon the opposite side of the body. There should not be a single exception, if the fibres which cross each other in those parts go to produce movements in muscles upon the opposite side of the body, for irritation of those fibres would always produce convulsions upon the opposite side. As there are many, many cases in which disease in these parts upon one side has produced convulsions upon the same side of the body, it is clear that these fibres are not what it is pretended they are. I think the facts as examined clearly show that the voluntary motor fibres supposed to exist in the base of the brain and to decussate there—those from the left side of the brain for the right side of the body, and those from the right side of the brain for the left side of the body—have no existence as such. That there are fibres there which participate in the production of voluntary movements I will not deny, but they are not essential, nor are they motor fibres, as has been heretofore imagined. I will take up the subject in a subsequent lecture, and will then try and show by what mechanism the will-power acts upon muscles, and will give some rules which will lead to diagnosis of the cause of paralysis and convulsions, even when those cases appear to be in discord with the present theory.

HEMIPLEGIA CAUSED BY DISEASE IN THE CEREBELLUM, ETC.

I have now to deal with hemiplegia caused by disease in various parts of the brain; and I will first consider hemiplegia caused by disease in the cerebellum.

I will say that any one among you who will devote a few hours of study to individual cases of disease of the cerebellum, taking them at random as they are re-

ported in medical journals, and without selection at all, will at once find that almost any symptom can appear from disease of that organ. You will also find that there is no symptom which is constant. What the entire function of the cerebellum is, I do not know; but I believe one of its functions is to produce nerve-force. The only constant symptom that is present in disease of the cerebellum is general weakness, debility, and usually upon both sides of the body. Even in those cases in which there is a localized paralysis, there is usually debility in cases of disease of the cerebellum. There are many symptoms, however, which belong to disease of that organ, so that paralysis coexisting with those symptoms would lead you to suspect what part of the brain is diseased. One of the most important of these symptoms is loss of sight, and this symptom is very frequently present in cases of disease of the cerebellum. Why, you will ask, is there loss of sight? With the view I hold, that any symptom may appear from disease anywhere in the brain, it is very easily explained. There is no direct connection between the cerebellum and the eye. It has been supposed that when disease existed in the cerebellum, if attended by loss of sight, it was because of pressure upon the tubercula quadrigemina. If it were true that the tubercula quadrigemina were the nervous centre for that sense, there would be some reason in the supposition; but what of those cases of disease in the cerebellum attended by loss of sight, and in which there was no pressure upon this nervous centre?

As is the case, disease in the left side of the cerebellum may produce amaurosis of both eyes, or amaurosis of the right or of the left eye. So there is no connection, not the least general connection, between the part which is affected in the cerebellum and the eye that is to be affected.

Another point: there are many cases in which disease in the cerebellum, of very slight extent, occupying the back part of the organ, and in which there was no possibility of pressure because of the nature of the disease, it consisting only of softening or inflammation, has caused amaurosis. As regards amaurosis, some medical men have tried to explain it by saying that an effusion of serum into the ventricles of the brain occurs in connection with disease in the cerebellum, and that that is the cause of the disturbance of the sense of sight. It is an important feature in all cases of disease of the cerebellum that there will be considerable production of serum in the lateral ventricles of the brain. There is a fact to be considered in this connection, and that is, that the sinuses of the brain are pressed upon by disease in the cerebellum, and it may be to such an extent that the circulation is greatly changed in one half, or in both sides of the brain. As you know, pressure upon veins anywhere in the body will produce effusion of serum. It is natural to admit that there is such an occurrence in connection with disease in the cerebellum, and this is in harmony with several facts. Disease in the cerebellum, if it causes amaurosis, does so, in most cases, by alteration of the nutrition of the eye, or by producing an inhibitory action, which I consider the great cause of the cessation of the activity of any part.

What are the other symptoms which can show that the paralysis with which we have to deal depends upon disease in the cerebellum? There are two symptoms which are of frequent occurrence, besides the amaurosis. There is headache, chiefly in the back part of the head, although it may exist in other parts. It is a headache that is much more violent than any headache which we know of dependent upon brain disease.

There is vomiting, and this is also a frequent symptom. Now, if you take the views admitted in science, that contractions of muscles take place when there is disease in the brain, because of irritation of fibres which extend from that part diseased to the muscles, and so serve to produce voluntary movements, how can you explain the vomiting which occurs when there is disease of the cerebellum? There is no voluntary motor fibre connecting the cerebellum directly with the stomach. The cerebellum has never been imagined to be the nervous centre that produces movements of the muscular fibres of the diaphragm and the stomach, which muscular fibres act together in the production of vomiting. So vomiting, in this case, is a reflex symptom, as I believe it is in every case of disease of the brain. There is an irritation of certain fibres which is transmitted to cells at a distance (I do not mean to say where these cells are), and they manifest it by putting into action the walls of the stomach and muscular fibres of the diaphragm, and produce vomiting.

PECULIAR DISORDER OF MOVEMENT.

There are other symptoms of disease in the cerebellum which are interesting. One which has been the subject of a great deal of discussion is a peculiar disorder of movement: the patient seems like a drunken person. If he can walk at all, he walks as if intoxicated. It is not that peculiar disorder of movement seen in locomotor ataxy, when the patient, instead of throwing the limb directly forward as in health, will swing it one way or the other, and strike the ground with the heel first; but it is simply a disorder of movement such as is seen in a case of drunkenness. This symptom is sometimes very marked. Another feature is, that the patient cannot stand upon one foot while the eyes are closed. This symptom is also present in the other form of ataxy.

There is lack of power to balance the body in many cases of disease in the cerebellum; but you are not, therefore, to conclude from that, that the cerebellum is the nervous centre employed in maintaining the equilibrium in giving proper balance to the body. It has been said that the cerebellum is the nervous centres for muscular sense. Muscular sense has been said to be the guiding power of our movements, and that if it is lost it is natural that there is developed a condition of apparent drunkenness. It certainly is not owing to the existence in the cerebellum of a nervous centre which presides over the balancing of muscular action, that there is disorder of muscular movement when the cerebellum is the seat of disease. For there are many cases in which there has been destruction either of the whole or a great part of the cerebellum, without any trace of disorder of muscular movement. If the cerebellum were a nervous centre for muscular sense, or for balancing the muscular movements of the body, certainly when destroyed there would always be present disorder of those muscular movements.

DIARRHŒA DUE TO IMPURE SALT.—A few weeks ago a large number of patients in different departments of the General Hospital in Vienna were suddenly attacked with diarrhœa. A chemical examination revealed the fact that the outbreak was due to impurities in the salt used in cooking. This contained a large proportion of sulphate of magnesia. The diarrhœa disappeared as soon as a pure salt was substituted for the impure article.

CLINICAL LECTURE.

By PROF. T. GAILLARD THOMAS, M.D.,

November 23d, 1877.

(Reported by P. Brynberg Porter, M.D.)

I. A CASE OF ABDOMINAL PREGNANCY—REMOVAL OF FŒTUS BY ABDOMINAL INCISION—THE QUESTION OF REMOVING THE PLACENTA. II. PERI-UTERINE CELLULITIS — THE SIGNIFICANCE OF LACERATIONS OF THE OS UTERI—THE DANGERS OF THE UTERINE PROBE. III. POST-UTERINE FIBROID.

Gentlemen:—Four weeks ago to-day the negress whom we decided to be the subject of abdominal pregnancy was presented to you for the first time at the clinic, and one week ago, as it is hardly necessary for me to remind you, I gave you some account of the operation which I had performed upon her the day previous: cutting through the abdominal walls, removing the fœtus, and leaving the placenta *in situ*, after having passed a strong silver wire through its body, by which to remove it in case it should become detached. At the time I made my report to you, twenty-four hours after the operation, the patient, you will remember, was in excellent condition, and though by no means out of danger, her chances of recovery seemed quite as fair as we could possibly expect at so early a period after the operation. On the fourth day after the removal of the child, however, while I was temporarily absent from the city, the patient began to develop unfavorable symptoms, and when I reached the hospital I found her in a very alarming condition, the temperature having run up to 103¾ degrees, and there being every indication of the development of septicæmia. I at once made up my mind that there was but one thing to be done, and having reopened a considerable portion of the abdominal wound, which, as I told you, had been closed with sutures, with the exception of about two inches, and in which I found union had already taken place by first intention, I withdrew quite a large quantity of exceedingly fetid fluid from the cavity. I then washed it out thoroughly with copious injections of salt water containing sufficient carbolic acid to give it a slight pungency to the taste, and finally allowed a considerable quantity of the liquid to remain in the cavity. All this occupied about half an hour, and during that short interval the temperature actually fell from 103¾° to 99¼°; showing that the patient was not actually suffering from septicæmia, but that septic absorption (from the fetid fluid described) was already taking place; and this is usually the first step towards septicæmia. Since then, I am happy to report, the patient has been doing very well; but up to the last day or or two it has been necessary to repeat the antiseptic injection about every three hours, night and day, and one of the house-staff has remained constantly with her for this purpose. The guide for the frequency of the injections has been and is the thermometer, and whenever the temperature has been noticed to rise they have been repeated.

At present it is found necessary to use them only about four times a day, and to-day I learn that the temperature is 99¼°; the pulse 102. The placenta still remains in position, as we have been very careful not to disturb it in the least, and it has as yet shown no signs of coming away spontaneously. I confess that I am afraid to remove it, and I certainly shall not do so unless it should show a decided tendency to slough off. It is probable that if it were removed at the present time, so long after the operation, there would be but little or no hemorrhage; but the condition of the patient would not thereby be improved in the slightest degree. On the contrary, the removal of the placenta would inevitably increase the risk of septicæmia by enlarging the area of surface for the absorption of septic material.

The patient is now quite as cheerful as she was the day when she first came here, her appetite is good, and she takes a considerable quantity of beefsteak, soft-boiled eggs, and other nourishing food; so that altogether her condition is so favorable that I think we can anticipate the happiest results in the case.

PERI-UTERINE CELLULITIS.

The first patient whom I show you to-day is Mrs. Bridget F., a native of Ireland, and thirty-three years of age. She has been married twelve years, and has had three children, the youngest of whom is now eight years of age. In our usual manner I will proceed to question her, in order to draw out the history of her trouble. How long have you been sick, Mrs. F.? "Just a year." You had good health before that time? "Yes." How were you taken ill? "I was taken with a great pain." Very suddenly? "Yes." What was the cause of it? "I do not know, but think it was from cold." Where was the pain situated? "Down around here" (placing her hand upon the pelvic region). Were you so sick as to have to go to bed? "Yes." For how long? "About a week." Was it at the time of your monthly sickness that the pain came on? "Yes." Did the pain go away at the end of the week during which you were confined to bed? "It got a little better then, but I have had it ever since." Are there any special times when it is worse than at others? "Yes, always at the time of my monthly sickness, and also at night." Has your general health failed? "Not a great deal." Have you lost any flesh since you had the attack of which you speak? "I did lose a great deal for a time, but think I am gaining a little now." Have you any trouble in walking or standing? "I can walk pretty well, but it hurts me to stand." Is there anything else of which you complain? "No."

I have now succeeded in getting all the history that I desire in the case. Here is a patient who tells us that she was perfectly well up to one year ago, when she had a violent attack of hypogastric pain, at the time of the menstrual epoch, which confined her to bed for a week, and she has never been well since. At the end of a week she got up, and then for the first time, as she tells me, consulted a physician, who seems to have understood the character of the attack, since he told her to keep as quiet as possible, not to lift heavy weights, etc. The pain has been constant ever since, and it is usually worse when she lies down at night; while it is always greatly aggravated at the time of menstruation. She has also become considerably emaciated, though that condition is not so marked at present as it was some little time ago.

The physical examination was as follows: On passing my finger to the cervix, the patient lying upon the back, I found it was normal in size and position, though there was a slight laceration in it. As I have had occasion so frequently to remark, this little nicking of the cervix is the rule, and not the exception in women who have borne chidren; and I do not consider them of any consequence whatever. I do not wish you, however, to confound this with the more extensive lacerations of the neck of the uterus, which frequently give rise to the most serious results, and in connection with which I recognize to the fullest extent and most gratefully the value of the labors of

Dr. Emmet, who has so ably brought the subject to the attention of the profession. But Dr. Emmet does not consider these slight lacerations of any more consequence than I do, and I do protest against the practice of some meddlesome gynecologists of the present day, who do not appreciate the vast difference between the two sorts of injuries to the cervix, and who can never rest content until they have sewed up everything of the kind, however insignificant it may be. I have made this little digression simply for the purpose of putting you on your guard against laying more stress upon slight laceration of the cervix than it deserves.

When, now, I attempted to draw the cervix forward, I found that this was impossible, and, in fact, that the uterus was perfectly immovable in any direction. This condition of fixation was so marked that almost any medical student, however inexperienced, would not have failed to recognize it. Now, a fixed uterus is an abnormal uterus; not necessarily diseased itself, but at all events indicating disease of some of the pelvic organs. On making conjoined manipulation, I found that in Douglas's cul-de-sac there was a large hard mass, compressing to no small extent the rectum posteriorly, and that in the broad ligament of the left side there was another similar mass; while nothing abnormal could be felt about the right broad ligament.

I did not carry the examination any further, because I felt perfectly satisfied as to my diagnosis from the sense of touch alone. If I had not, I might have placed the patient on the side and introduced the speculum; but I certainly would have considered it very unsafe to pass the delicate and flexible uterine probe, to say nothing of the large and unyielding sound. And just here I want to impress a point of great importance upon you. The careful passage of the probe in the hands of an experienced uterine surgeon is, as a rule, almost altogether unattended with risk; but that of the sound is by no means so harmless. The introduction of the probe and of the sound are most assuredly two very different procedures. When the first edition of my work on diseases of women was published, some of the German authorities criticised it very severely, because, as they claimed, I said the introduction of the uterine sound was unattended with danger, when they knew positively that it *was* attended with danger. The criticism was unjust, however, for I never really said anything of the kind. What I did say was, that the passage of the *probe* was unattended with danger when performed in a certain manner. I may illustrate this point by the somewhat analogous introduction of the sound into the male urethra. A skilful surgeon with a proper instrument may perform the operation without the slightest bad result; but if a rough instrument is passed in a rough manner, incalculable mischief may result. Let us suppose, now, a case in which there is retroflexion, and that the attending physician, without knowing at all the position of the uterus, attempts to carry a sound up in the normal curve of the organ. If he persists at all, he may do a great deal of injury, not only to the uterus, but to the bladder and intestines as well. But if the slender and flexible probe is used cautiously and skilfully, how different is the case! Take, for instance, the cases in the Woman's Hospital. A very large number of patients are treated there every year, and in every instance the probe is used in the examination, instead of the sound, unless there is some peculiar reason for resorting to the latter, because my colleagues all recognize, as well as I, the dangers which are to be apprehended in the use of the sound. As a consequence, we have no accidents due to this cause. Now, in the present instance, what do the marked fixation of the uterus and the hard masses which we have found posterior to it and upon one side of it, signify? They are undoubtedly evidences of peri-uterine cellulitis, and consequently I would not venture to introduce even the probe here, for fear of lighting up fresh inflammatory trouble. This inflammation of the pelvic cellular tissue must have originally occurred at the time of the acute attack, which the patient has described to us, and, as a consequence, Douglas's cul-de-sac was completely filled up with a deposit of exuded lymph. But all the trouble did not end here, for this is one of those cases of progressive cellulitis in which a certain amount of fresh inflammation is set up at each menstrual period, in consequence of the congestion of the pelvic organs incident to that physiological epoch. At the present time the patient's hands are quite hot, and she tells us that not infrequently she has more or less fever.

Now, you can see the importance of this point which I wish to make in connection with the case before us. The lesson to be learned here is, always to find out as fully as possible, by means of the vaginal touch and conjoined manipulation, the condition and position of the uterus before passing either the probe or the sound. As I have already intimated, I never use the sound at all, unless there is something special to be gained by it; and I would emphatically warn you to be always careful to think before you resort either to it or the probe. I will venture to say that there is scarcely a gynecologist of extensive experience living who has not unwittingly produced abortion by the passage of one or the other of these instruments. Almost every one gets caught at some time, and finds to his horror that the sound or probe has passed four inches into a gravid uterus; the innocent little operation being followed by hemorrhage and the expulsion of the fœtus. Therefore, always proceed with the greatest caution in every instance. Only yesterday I saw at my office a case of great interest in this connection. A Canadian lady, who had been charged by the physician whom she had when in London some little time ago, to consult me in case she should have any uterine trouble in the future, came to seek advice, and told me that she thought she had a small polypus growing from the cervix uteri. On making an examination I found that this was really the case, and I had no difficulty in twisting the polypus off with a pair of forceps. The cervix uteri looked like a very inviting one into which to pass the uterine probe, and I would have done it if there had been any special reason for it. But, in the meantime, I had been questioning the patient in reference to her case, and she now presented to me a letter from her former physician in England, Mr. Knowsley Thornton, in which he stated that he had removed both ovaries and the entire body of the uterus, and particularly warned any one making a vaginal examination of the patient, not to attempt to introduce a probe or sound, as it would pass directly into the peritoneal cavity. It was one of those brilliant cases illustrating the triumphs of modern uterine surgery, which reflect so much credit not only upon the operator, but upon the whole profession as well.

But to return to our present patient. In a case of peri-uterine cellulitis, I would say, then, never pass the probe; and I cannot dwell with too much emphasis upon this point. But, you say, perhaps there is something to be learned by this means? Well, then, be cautious how you learn it. I see in my audience to-day a gentleman, in consultation with whom I have seen a patient in three several violent and dangerous attacks of pelvic inflammation, all of which

were set up by the simple manœuvre of probing the uterus. Once he passed the probe himself, but on the other two occasions it was done by other practitioners. The danger is particularly great in cases of progressive pelvic cellulitis, like the one now before us. I might pause here a moment to inquire, Are we perfectly certain of our diagnosis in this case? I know of no other condition whatever which could have originally produced, and can now fully explain, all the rational and physical signs of the case.

In the way of treatment there is, unfortunately, not a great deal to be done. First of all, however, the patient should be removed altogether from the field of her present labors, where there is always so much to be done by women in her condition of life, and fortunately there are plenty of institutions at the present day open to the poor, where such patients can enjoy perfect rest. Securing quiet is the most important element in the treatment of this case, and this is of special importance at the time of the monthly sickness. The patient should be confined strictly to bed from the time when ovulation first begins (several days before the appearance of the flow), which is indicated to her by the increased pain and sense of weight incident to the congestion of the pelvic organs, until menstruation is completely over. In addition, she ought also to abstain entirely from the marital embrace, and this will be one of the advantages to be derived from a residence in a hospital. But what medicines are to be given her? you may inquire. I do not know of any drug or drugs that will cause the disappearance of the inflammatory products here present, or put a stop to the progressive cellulitis, or else I should have mentioned them first. No doubt quite a number of you would like to suggest "a mild course of mercury;" but I have no faith whatever in the efficacy of any course of mercury. Quite as many more would doubtless suggest the prolonged use of the iodide of potassium; but such a course of medication would only derange the digestion, impoverish the blood, and impair the general health of our patient, without accomplishing anything at all in the way of the removal of her trouble.

There is one point, however, which should receive our most careful attention, and that is the constipation which almost invariably marks these cases of peri-uterine cellulitis.

The pressure of these phlegmonous masses in Douglas's cul-de-sac, and the presence of inflammatory bands of adhesion, not infrequently cause fæcal impactions which greatly aggravate the severity of the condition, and should always be avoided by the strictest care in regard to the patient's bowels. In addition, she should have the most nourishing food, and such tonics as will improve the condition of her blood and build up her whole system. In a more acute case than the present one, in which, you will remember, the patient has been suffering for a year, I would recommend the systematic use of counter-irritation; but I do not believe it would be of service here. Opium ought by all means to be avoided, if its use can possibly be dispensed with, on account of the danger of the patient's becoming an opium-eater in consequence; which has been noted by quite a number of observers to be a not infrequent result in these cases of chronic cellulitis.

POST-UTERINE FIBROID.

Mrs. Sarah S., thirty years of age, and a native of Ireland. She has been married twelve years and has had five children (the last four years ago), but no miscarriages. How long have you been sick, Mrs. S.? "Four years." Were you quite well up to four years ago? "Perfectly." What do you complain of? "Pain at times." Where is it situated? "Here" (placing her hand upon the pelvic region). Are you regular in your monthly periods? "No." In what way are you irregular? "I have my sickness too often, and lose too much blood when it is on me." Have you any pain in your back? "Yes." Is it constant? "No, I do not feel it all the time." Are your bowels regular? "They are always constipated." Do you have any trouble with your bladder? "I feel a very frequent desire to pass water." Do you suffer at all from the whites? "Yes." When your monthly sickness comes on, do you lose a great deal too much blood? "No, not a great deal more than I ought to do." Does it hurt you to stand? "It makes me feel very tired."

Now, gentlemen, you have heard the history as given by the patient. She looks healthy, you will observe, except being a little pale, and I will proceed to tell you what I found in making a physical examination. The patient being placed on her back, I passed my finger up to the os uteri, when the first thing that I noticed was a slight laceration, such as we found in the last case and such as is so frequently met with. It is a little more marked than in the last case, but still by no means sufficiently extensive to give rise to any trouble. Unlike the last case, the cervix was perfectly movable, but still I found a mass filling up the whole post-uterine space. This mass was very hard and much larger than the uterus ought to be, almost closing up the rectum, and yet I could not feel the body of the uterus in its normal position. Now, I said to myself, here is a case of retroflexion with hyperplasia of the uterus, and this was the picture that mapped itself out in my mind. I was not able to decide positively, however, without the introduction of the probe, on account of the unusual rigidity of the abdominal walls in this case, which interfered with the success of any examination by conjoined manipulation. The patient was accordingly placed upon her side and the speculum having been introduced and held by an assistant, I bent the probe to what I thought was about the right curve, and attempted to pass it downward. Finding that this was impossible, I then attempted to pass it upward in the normal direction, but it would not enter the body of the uterus in this way either. So I withdrew it altogether, and making it almost straight, I again introduced it into the cervix, and this time passed it up to the extent of four inches very easily, which was not at all the picture which I had imagined. The reason that I had not felt it in front, was that it was so much farther back from the abdominal walls than usual. A careful examination revealed an immensely large mass blocking up the rectum, and this I found to be a growth attached to the posterior wall of the uterus. But might not this be a mass of inflammatory lymph, as in the last case? No, because when you find a hard mass in Douglas's cul-de-sac, and are able to move it, it is not a deposit of lymph. This is not an absolute rule, but the exceptions to it are exceedingly rare. The lymph, when present, is firmly attached to the walls of the pelvis, and in the last case I could not only not move that, but could not move the uterus either. In the present instance I used the sound to rock the uterus backward and forward in order to ascertain whether the mass, whatever it was, was attached to the uterus, and I found that it undoubtedly was. But, you say, is it not dangerous to employ the sound? Yes, there is certainly some risk in so doing, but I decided that the benefit to be derived from its use was

quite sufficient to justify the latter. Even the simplest procedures in surgery are attended by a certain amount of danger. Many children have died from having their gums lanced, and I think it is Sir Henry Thompson who has noted a number of deaths merely from the passing of the catheter. The size and character of the growth were further determined by introducing the finger into the rectum.

What is the prognosis here? When I speak of prognosis, I do so in the real meaning of the word, which does not require us to tell positively what will be the whole future history of the case. What I understand by the term is, the most logical deductions that you are able to make from ascertained facts in medical literature and your own personal experience. This is a benign tumor, and, as a rule, these hard, round fibroids will permit a woman to go to a good old age. Perhaps I may be mistaken here, and the patient may possibly come back in the course of a year with the tumor as large as your head; but I think this is altogether improbable.

In the treatment there are three principal points to be attended to. The first is to remove the pressure from the rectum by changing the position of the tumor, and this is to be done by throwing the uterus over on to the bladder and thus lifting the mass out of the true pelvis. The pain from which the patient suffers is greatly increased by the pressure of hard fæces in the rectum, inducing a neuralgic condition of the fibroid. For a time the uterus should be thus carried forward two or three times a week, the patient being in the knee-chest position, and then after a little while a Cutter's pessary may be introduced, which will keep it permanently in a somewhat anteverted condition. Should any trouble be created thereby, it may easily be obviated by leaving the pessary out for a time. Secondly, the patient should take about twenty drops of Squibb's fluid extract of ergot night and morning, in order to keep up a constant impairment of the circulation of the uterus. If we had an interstitial fibroid to deal with, we might expect the ergot to act by causing contractions of the uterine fibres; but here we have to depend on the general property which the drug has been shown to possess by Brown-Séquard and many other observers, of diminishing the calibre of blood-vessels. In the third place, we must improve the general condition of the patient. I do not look upon this affection as showing an exuberance of health at all, but as an evidence that her health is depreciated; and our efforts are therefore to be directed towards improving the nutrition and building up the strength.

I have still two points to speak of in connection with this case, and the first is this: Suppose the patient should begin to bleed freely. At present there is not much hemorrhage, but a tumor of this kind is apt to cause flooding by keeping up a continual congestion of the uterus, and the use of the curette upon its lining mucous membrane will be found to control the menorrhagia and often the metrorrhagia resulting from it more effectually than any drug. By this means the condition of the mucous membrane is altered, and in the intervals we thus help the patient to recover the ground lost at the time of her menstrual periods.

Finally, I wish to caution you against giving iron and quinine in cases like this. It is the commonest thing in the world to see such patients taking these two drugs in large quantities, because their attending physicians are desirous of improving and increasing the blood and stimulating the appetite; but from my own experience I can declare positively that they constitute the best possible prescription to excite hemorrhage, and consequently are productive of much harm. It is like giving alcoholic stimulants to a man who is suffering from delirium tremens. It may ward off trouble temporarily, but in the end it only makes his condition a great deal worse. Now our patient theoretically really needs both these remedies, but I feel sure that they would practically only do her further injury.

PERITYPHLITIS, AND ITS TREATMENT.

By LEONARD WEBER, M.D.,

NEW YORK.

(Read before the Surgical Section of the New York Academy of Medicine, December 11, 1877.)

In addressing you upon the subject of perityphlitic abscess, Mr. President, I have reference in particular to abscess resulting from perforation of the appendix vermiformis. Perityphlitis in a general sense, of cæcum or any part of colon, occurs frequently, and may go on to resolution quite as often as to the formation of abscess; and the latter may and often does perforate the bowel or bladder, and the patient will get well without any surgical interference. I have seen a number of such cases before I ever operated for abscess of the vermiform appendix, and, in my opinion they may be considered, apart from this special form of perityphlitis, due to perforation of the appendix vermiformis.

In those cases the characteristic tumor does not grow up from the bottom of the iliac *fossa*, is felt more superficially and higher up along the cæcum or colon, not unfrequently fluctuates, and sometimes disappears over night, being evacuated by the bowel or bladder.

For the literature on the subject, I refer you to my first paper, published in the *N. Y. Med. Journ.* of August, 1871, to the well-known papers by other American authors, and to the Encyclopædias of Virchow and Ziemssen.

For the formation of an abscess after perforation of the vermiform appendix, we have to depend upon a sufficient amount of adhesive inflammation around the ulcerated spot, in order to prevent the escape of fluid into the peritoneal cavity before perforation has actually taken place. When no adhesions have been built up prior to the perforation of the ulcer, general peritonitis will supervene, with early fatal termination. I have made the autopsy of two cases in which there was perforation with no attempt at adhesive inflammation, and general peritonitis was found.

Permit me to give you briefly the history of three cases I operated on since 1874, and to invite your discussion on the mode of proceeding which experience has taught me to adopt.

H. W——, 30 years of age, merchant, a robust and healthy man, who had never before had any trouble with his bowels, came to my office on June 3, 1874, complaining of pain in his abdomen. Ordered purgative. He called again on the 7th, 8th, and 9th of June. Bowels had been relieved, but pains still present, and more in the right lower part of abdomen. Ordered an opiate, strict diet, and rest. June 10th I saw him at his house, found him with fever, and pain in the ileo-cæcal region well marked. No tumor could be felt, the less so as palpation was difficult on account of the great thickness of abdominal parietes and existing tympanites. From this day on, all the usual symptoms of perityphlitic abscess were present, although it was not until the end of the fifth day from my first visit that I was able to make out

the characteristic tumor in the ileo-cæcal region; nor could I at any time feel any part of tumor per rectum. The patient having been kept under the influence of opium, and the tumor steadily increasing in size, I concluded to operate on the ninth day. The tympanitis, which was unusually troublesome and greatly interfered with the patient's respiration and sleep, had had no small share in urging me to operate early.

The operation was done by a four and a half inch incision above and parallel to Poupart's ligament, narrowing down to an inch and a half at the fascia transversalis. The exploring needle having been thrust into the tumor, showed the presence of pus, and the abscess was laid open. From four to six ounces of fetid pus and gas, mixed with small portions of sloughy fibrous tissue, were evacuated, the cavity was washed out with carbolized water, the edges of wound carefully cleansed and united by harelip, and interrupted sutures and a drainage-tube inserted. The further treatment of wound was carried out on the antiseptic plan; the patient progressed favorably, and on the twelfth day after operation a small and hard fæcal lump was discharged. On the fifteenth day an attack of traumatic erysipelas set in, spreading from the wound upwards as far as the short ribs and back over the hip as far as the spine, reaching posteriorly and anteriorly as far as the median line. The accompanying fever was very high, marking sometimes 104 degrees in the axilla, and the pain and discomfort to the patient were considerable. The affected parts, including wound, were freely painted with tar four times daily, and teaspoonful doses of tinct. ferr. mur. exhibited every four hours. The erysipelas spread no further, and entirely left the patient five days after the seizure. The wound, which presented an œdematous and inflamed appearance, and discharged but little yellowish liquid during the attack, suppurated more freely again afterwards, and healed without further disturbance, with a broad and firm cicatrix, on the thirtieth day after operation. The pins introduced to hold the edges of the wound well together caused some sloughing, although they were removed at the end of the second day, and their suppurating tracks took almost longer to heal than the wound itself. About two months after operation the centre of cicatrix was nearly an inch in breadth, and protruded slightly when the patient made efforts to cough. He was ordered to wear a truss to prevent the formation of hernia, and wore it for a year, or more, I believe.

A. Z——, 32 years of age; merchant; a tall and thin man, with a good family history; had always been in fair health until 1873, when he began to suffer from occasional attacks of colic, which were relieved by purgatives, anodynes, and rest in bed. Similar attacks he had also in 1874, combined with troublesome dyspeptic symptoms. In the night of March 28, 1875, I was sent for, and found him suffering severely from an acute attack of pain in the abdomen, more to the right lower side. For some time before this sudden seizure he had been well and in daily attendance upon his business. He presented all the symptoms of incipient peritonitis, and was put under the influence of opium at once. On the fifth day, the tympanitis having yielded, the bowels were evacuated by an enema. I could now feel the tumor in the ileo-cæcal region, and discovering fluctuation, although deep-seated, on the evening of the sixth day, I operated at noon of the seventh, in precisely the same manner as in the foregoing case, reaching the cavity of the abscess without difficulty, and evacuating about six ounces of fetid pus and gas. Although a good deal of sloughy connective tissue was discharged at and after the operation, no foreign body was seen. The wound was treated in the same manner as above, and everything went well for some time, although the patient was excessively weak, requiring constant attendance and careful nursing. In the third week after operation—the wound still suppurating freely—another abscess formed in the neighborhood and a little above the first one, with eventual perforation of the bowel and discharge of pus per rectum. In the sixth week additional inflammation occurred, and an abscess formed close to the left lower side of the first, which perforated the bladder, with free discharge of pus per urethram for about a week. In spite of these secondary abscesses and the continued suppuration from the wound, the patient held out under good nourishment and the generous exhibition of stimulants, and was restored to health three months after operation. The centre of cicatrix was broad and thin, and required the support of a truss. As soon as he was able to be about, I sent him to the mountains of Virginia, where he spent the month of August, using the baths at Hot Springs. He regained his strength, and had no trouble with his bowels afterwards, except a slight tendency to constipation.

E. R——, 17 years of age, clerk, a well built young man, had no serious illness previously; was taken on February 15, 1877, with symptoms of acute peritonitis, which soon became localized in the ileo-cæcal region. Ordered leeches, poultices, and opium. On the 17th less pain in abdomen and generally much better. On the 19th tumefaction more distinct; 20th, abscess pretty well defined; 21st, no change locally; 22d, tympanitis increasing. On the 23d, at 4 P.M., operation by a four-inch incision, narrowing down to an inch and a half at the fascia transversalis, and evacuation of about five ounces of pus and gas. No foreign body on this or any subsequent day. Very little fever, and voluntary stools on the 25th; wound looks well and discharges copiously. Sutures removed on the 26th, and I will here mention that they were of fine silver wire, closely laid, embracing all the tissues, and that no pins were used for lateral support. I was much better satisfied with the appearance of the wound closed in this manner than in the previous cases in which pins were employed. On March 12th the wound had nearly closed, and the patient was well except occasional attacks of colic in the left lower part of abdomen. He very soon got over these, and I did not see him again until about three months after operation, when he presented himself at my office on account of some protrusion of the centre of cicatrix. He was ordered a suitable truss for support. Patients Nos. 2 and 3 have laid their trusses aside, feeling quite comfortable without them. The cicatrices appear to be quite firm now.

When we let these cases and others of abscess of the vermiform appendix that have been published pass in review, we find that, whether they set in abruptly or gradually, with peritonitis and tympanitis more or less severe, they are always marked by considerable pain on pressure in the ileo-cæcal region. There is only one symptom which may be called pathognomonic, a tumor growing from the bottom of the iliac fossa and above Poupart's ligament up towards the integuments. This gradually growing tumor can generally be felt by palpation; rarely can its lower circumference be made out by exploring per rectum. Seldom can we feel distinct fluctuation, and percussion generally yields a muffled tympanitic sound. The abscess containing always pus and gas, the percussion-sound over it cannot be entirely dull.

When shall we operate? The formation of the ab-

scess begins with the adhesive inflammation set up by the ulceration of the vermiform appendix, and experience teaches that, counting from the commencement of peritonitis, at least seven days are required to accomplish agglutinations firm enough for surgical purposes, between the fibroplastic walls of the abscess and the parietal peritoneum. Cases Nos. 2 and 3 go to prove that we can successfully operate on the eighth day, and, other things being equal, I see no reason why we should wait any longer than the second week. We have to deal with an abscess containing fetid pus which we know to be of an aggressive nature, and the sooner we have it evacuated the better for our patient. However, there are a number of cases on record in which the operation has been deferred to the end of the second week and even longer, and the patients have made a good recovery. Sometimes, the general condition of the patient may be such as to induce the surgeon to postpone the operation somewhat beyond the time indicated by the local condition. How long shall the incision be, and where had it best be made? In none of my cases has the cut through skin and fascia been less than four inches in length, narrowing down to two inches at the fascia transversalis. The opening in the wall of the abscess was an inch to an inch and a half long, in order to give me all the facility I wanted for washing out and disinfecting its cavity. You are aware that in three of the cases a tendency to hernia was developed soon after cicatrization, and a truss was required for support for some months, but the patients could soon get along without it. You recollect that the late Dr. Gurdon Buck, in a paper read before the New York Academy of Medicine, July, 1875, communicated two cases of perityphlitic abscess successfully operated upon by him. The plan of operation adopted by him was, first to puncture with a fine trocar, and then make an incision along the needle into the abscess sufficiently large to allow the introduction of the finger into it. It answered the purpose, and the patients got well with a sound cicatrix and no tendency to hernia. Although it has been shown that a long cicatrix must not lead to bulging at the centre, it is desirable to avoid such unpleasant consequences by making the incision no longer than is absolutely necessary, *i. e.* from three to four inches. Dr. Buck's method has one serious defect: the surgeon is obliged to cut in the dark through thick layers of muscle and fascia, and after opening the abscess, cannot wash out and drain its cavity as well as it ought to be done. Moreover, when we close the wound with many and fine sutures as accurately as possible—leaving out all pins for lateral support—we shall get the greater part of it to unite by the first intention, and have ultimately a firm and good cicatrix. And if we instruct the patient to put on a suitable truss as soon as he leaves the bed, and wear it for some months, we shall have guarded against all possible chances of hernia developing at the centre of cicatrix.

In making the incision I go straight for the abscess and operate in the following manner: Putting the thumb of the left hand in the inguinal fold close to Poupart's ligament, I lay the four fingers well upon the upper circumference of abscess, making gentle but firm pressure downward. Midway between thumb and fingers thus placed in position, I divide skin, fascia, and the fibres of the external and internal oblique muscles, enter the exploring needle at a point where I have felt certain that I shall get pus, and getting it, carry the knife through the remaining tissues into the abscess by a single cut. This is by no means a summary proceeding when you have watched your case well from the beginning and become familiar with every feature of it, when you have marked the gradual growth of the abscess, and by repeated examination expelled from your mind all doubts about the presence of pus in a locality where you can but seldom get well-marked fluctuation.

Immediately after operation I wash out the cavity of the abscess with carbolized water, and twice a day thereafter, until the discharge has lost all its fetid odor, and the wound becomes too small for the further introduction of a drainage-tube. Hancock's operation for abscess of the vermiform appendix has not originated in this country, it is true, but Willard Parker has given us a formula for its proper and timely performance, and by careful study it has become a sound and useful mode of surgical practice.

TREATMENT OF DIPHTHERIA BY TURPENTINE INHALATIONS.

By C. EDEL, M.D.,

NEW YORK.

Before I enter upon the mode of treatment of diphtheria, it may not be inappropriate to give, in a few words, my opinion concerning the nature of the disease.

I regard it, in the majority of cases, as a local infection from the beginning, affecting the mucous membrane of the nose, pharynx, and larynx, the fatal termination of the disease being brought about by pyæmia. The latter may be either primary in cases where the poison has been absorbed by the capillaries of the lungs or the mucous membranes (and these frequently become fatal after a short duration, even without the formation of membranes); or the pyæmia may be secondary to the formation of membranes, and the poison is then taken into the system in the usual manner.

But we must distinguish this pyæmic fever from the reactive fever, common to all cases of diphtheria, and which I think is only an effort on the part of nature to eliminate the obnoxious substance.

The character of the disease has a close resemblance to the gangræna nosocomialis. If we have under observation a surgical patient, we may be certain about the favorable conditions of his wound as long as his temperature does not suddenly rise. When the latter occurs, all practitioners are aware that we must be upon our guard. It is not necessary that we find the wound in a bad condition immediately, but we are sure that this will follow after a short time, if the wound is not properly treated by disinfectants. If, however, this course of treatment is pursued, the temperature will soon become normal. The cases of secondary pyæmia in gangræna nosocomialis are relatively rare, since a more proper management of the wounds has been adopted, but they occasionally occur, and prove fatal in spite of the greatest care.

The object of my treatment is not to cure the primary pyæmic infection of the "malignant cases," or to cure the "secondary pyæmia" after the formation of membranes, but to prevent the absorption of the poison, the presence of which is indicated by the reactive fever.

Since the treatment of diphtheria by steam inhalations gives relatively the best results, I resolved to combine this method directly with a local disinfectant. For this purpose I use Tiemann's steam-atomizer in the following manner: I have the boiler half filled with water, add about fifteen drops of the oil of tur-

pentine before each inhalation, and then close it. As soon as the vapor escapes, the patient is placed at a distance of three inches from the mouthpiece of the instrument. This distance I found more convenient than to apply the mouth directly to the mouthpiece, since the greater heat might prove injurious and the force of the stream would frequently make it inapplicable to children. Formerly I have used the turpentine with some water in the medicine cup, but this arrangement often fails, and I find it quite sufficient to put the turpentine into the boiler directly.

The inhalations are made every hour for about ten minutes, day and night.

This treatment I have applied in quite a number of cases, and thus far with the most favorable results. Recent cases were cured in twelve hours, *i. e.*, the temperature was reduced and the sores in the throat were clean; in older cases it took sometimes twenty-four hours before the temperature became normal, and about forty-eight hours before the pharynx appeared perfectly clear.

I shall briefly relate a few of the more characteristic cases.

I. December 2d.—W. W——, a boy 6 years of age. When I first saw the patient he had been treated for three days with chlorate of potash locally, and tincture of iron internally. On inspection, the tonsils and pharynx were found to be covered by diphtheritic membranes. The boy complained of pain in the region of the sternum; his breathing was superficial, and he had very marked dyspnœa; his voice, however, was pretty clear. I continued the treatment for eight hours, but seeing that the infiltration had rather increased in extent, I resorted to the above-described inhalations. They were continued during the night, and after twelve hours the patient expectorated a piece of membrane five and a half inches in length and one inch in breadth, which had undoubtedly occupied the whole extent of the trachea; at the same time the pharynx was nearly clean. The pain, of which the boy had complained, ceased immediately after the membrane had been expectorated. The microscopical examination revealed, besides some epithelial cells, the presence of fibrine, small, round cells, and the peculiar organisms called micrococci.

II. November 29th.—B. S., a girl 3 years old. In this case I performed tracheotomy half an hour after I was called, on account of the great dyspnœa. There where no membranes in the throat, and I regarded the case as one of croup. A few hours after the operation the tube could hardly be cleaned from very tough membranes plugging the inner opening. Next morning diphtheritic membranes were seen in the pharynx. I ordered at once the inhalations, but, of course, in this case through the tracheotomy tube. The inner tube was taken out and the steam passed through the opening in the superior curvature of the outer tube into larynx and pharynx, After having used the inhalations for twelve hours, the pharynx was clear, and some relatively thin matter was discharged through the tube. The child recovered entirely, with the exception of a paralysis of the vocal cords, which will probably be cured by faradization.

III. November 28d.—M. R——, a woman 40 years old, in whom the infiltration extended almost over the whole tongue and the greater part of the pharynx; after twenty-four hours the temperature nornal, and about twenty-four hours later the mouth and pharynx clean.

IV. December 22d.—E. M——, 15 years old. Pharynx partly infiltrated; cured in twelve hours.

V. December 31st.—C. E——, 5 years of age; membranes on both tonsils. Inhalations begun on the third day; one tonsil clear after twelve hours, but it took about two days before the membranes on the other tonsil disappeared, the parents having neglected to use the atomizer during the night.

Progress of Medical Science.

URETHRITIS CAUSED BY THE ADMINISTRATION OF ARSENIC.—M. Saint-Philippe publishes in the *Gazette Médicale de Bordeaux* two cases in which the internal administration of arsenic was followed by urethritis. The first was a man of forty, suffering from malarial fever, for which arsenic was prescribed. He had, however, taken but four milligrammes of the remedy when he exhibited all the signs of poisoning. The following day he was attacked by a urethritis, which showed itself in a classical manner, at the same time he positively affirmed that he had not been exposed for more than two months previously. The other patient was put upon arsenic for some skin trouble, but owing to a mistake he took double the dose ordered, so that at the end of eight days he had taken sixteen milligrammes. Symptoms of poisoning now showed themselves, and at the same time the commencement of a well-marked urethritis, which yielded to the usual treatment in fifteen days. Here again exposure was denied for a long time previously, and taken in conjunction with the foregoing case, M. Saint-Philippe was forced to admit an arsenical urethritis, nor does he deem it illogical to suppose that arsenic, while being eliminated with the urine, may produce effects similar to those produced in the digestive tract and on the skin, where it is also eliminated. As, however, this is a toxic rather than a physiological irritation, the poisonous, instead of the simple therapeutic action of the drug, is necessary for its production. This is why it is so rarely met with in practice. This form of urethritis resembles that caused by certain substances known to have a very marked irritant action on the genito-urinary mucous membrane, such as cantharides, certain balsams, and even beer and alcohol in excess.—*Journal de Médecine*, November.

AN EASY, SURE, AND RAPID METHOD OF TREATING PARALYSIS OF THE FACIAL NERVE.—Dr. J. Masecarel claims great success for the following method of treating rheumatic paralysis of the facial nerve: From the first day he introduces a platinum needle a centimetre, or a centimetre and a half, in the direction of the stylo-mastoid foramen, toward the exit of the facial nerve from the cranium. A second platinum needle is placed horizontally in front of the orbit on the paralyzed side, in the superior fibres of the orbicularis palpebrarum; the needles are then connected with the poles of a battery of the desired intensity, and an interrupted current passed during twelve, eighteen, or twenty minutes. It is needless to say that very violent contractions are caused by this plan, almost convulsive in the orbicularis palpebrarum, and sometimes the eyelids are closed at the first sitting. The second day this operation is repeated with the palpebral needle below the eye. The third, fourth, fifth, and sixth days the facial needle is successively introduced into those muscles of the face which prove most refractory; the other needle is always kept near the stylo-mastoid foramen. After the seventh or eighth day of this treatment the paralysis has disappeared for ever in a dozen successive cases.—*Le Bordeaux Médical*, Sept. 18, 1877.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, January 19, 1878.

THE EFFECTS OF SECTION OF THE SPINAL CORD UPON ANIMAL TEMPERATURE.

Some time since the sum of five hundred dollars was granted to Professor H. C. Wood, Jr., of Philadelphia, by the Smithsonian Institute, to enable him to prosecute with thoroughness and success a series of experiments relative to the effects of artificial lesions of the various parts of the nervous system upon the evolution and production of animal heat; the results of the experiments to be published in the Contributions of the Smithsonian Institute.

Through the kindness of Dr. Wood we are enabled to lay before the medical profession his results, so far as concerns the effects of the *section of the cord* upon animal heat.

As is well known, experiments of much the same nature as those which we are about to describe were instituted in 1837 by Sir Benjamin Brodie, and later by Bernard, Schiff, Naunyn, and Quincke, Rosenthal, and Binz. According to these authorities it would seem that if the spinal cord of a rabbit be cut in the lower cervical region (the air of the room being lower than the temperature of the animal's body), the animal's temperature at once falls so that at the moment of death its heat is below normal. If, however, the external temperature be high, and the animal be wrapped in raw cotton, the fall of temperature is succeeded by a rise, so that the animal dies in a state of intense fever. The question naturally arose, of course, as to whether the subsequent rise of temperature was really due to the division of the cord, or was only a direct result of the higher external heat to which the animal was exposed. To settle this point a crucial experiment was undertaken by Naunyn and Quincke, which seemed to prove beyond a doubt that the rise of temperature was to some extent certainly dependent upon the operation.

In conducting his researches, Dr. Wood has confined himself exclusively to experiments upon the dog, other commonly employed animals being too small for the performance of delicate experiments upon the brain and nerves. A wooden box was constructed, open at the top, and about three feet square; also two metallic boxes, the larger of them also open at the top, and three inches smaller each way than the wooden box; the other about three inches smaller each way than the first, and having its top-piece perforated with three holes—a large hole in the centre, and, on each side of this, smaller apertures, into which gutta-percha tubes could be screwed. The arger metallic box was then placed inside of the wooden chest, and the interstices surrounding it carefully and tightly packed with sawdust. Water enough was poured into it—*i. e.*, the larger metal box—completely to surround the smaller metal box when placed inside of it. After cutting its cord, the dog was then placed within the innermost box, the gutta-percha tubes were screwed into place, and a closely-fitting lid to the whole apparatus so adjusted as to cut off both the dog and the water surrounding the vessel which held it from the outer air of the room. A suction-pump was attached to the end of one of the gutta-percha tubes (the end of the other tube being left patulous), so that air might be drawn through the metal box which held the animal. A cut-off from the tube of exit was so arranged that specimens of air could be received into it, and analyzed for heat by a thermometer, and for moisture by a calcium tube. The difference in the number of heat-units existing in the air, after its passage through the box, and in the water surrounding the box which held the dog whose cord was cut, was then estimated by means of the following formula: $Q = w \times t \times$ sp. h.; Q = heat-units; w = weight of air or water; t = rise of temperature of air or water; and sp. h. = specific heat.

The bulk of the air was reduced to the bulk of air at 32°. This was weighed and the specific heat obtained. After a number of painstaking and laborious experiments, Professor Wood has been able to reach the following conclusions, viz.: *At a low external temperature, after section of the cord, there is increased evolution with diminished production of heat; at a high external temperature, both the production and evolution of heat are diminished. After section of the cord the animal dies in winter of cold, and in summer lives much longer on account of the high external heat.* It will be at once noted that this fact has a very important application to narcotic poisoning, to collapse, as seen, after exhaustion by heat, etc., and to thermic fever; the hot bath being the best treatment for collapse and narcotic poison, and the cold bath for thermic fever. [Collapse from heat and thermic fever are usually confounded. In collapse the internal temperature is below normal, while in thermic fever it is above.]

Professor Wood has also discovered the fact that the instant fall of temperature, after section of the

cords, is due to *vaso-motor paralysis, producing paralysis of the arterioles at the surface, thus obliterating the superficial cold layer of the body, and removing the only barrier to the animal's internal heat.* The Doctor has thus shown that *temperature is no guide to the amount of heat given off in such cases, and that fever simply reduces itself to a question of the difference in the relation of the heat-producing and heat-evolving powers; that the heat-evolving power is no longer compensatory to the heat-producing when the cord is cut.*

The experiments of Owsjannikow, which located the governing vaso-motor centre of the brain in a space whose upper boundary is one or two millimetres below the corpora quadrigemina, and whose lower boundary is from four to five millimetres above the point of the calamus scriptorius (*Berichte*, etc.; Bd. XXIII.), have received full confirmation at Dr. Wood's hands.

PREVENTIVE MEDICINE IN ORDINARY MEDICAL PRACTICE.

DR. RANSOME'S able address on State Medicine, published in the *British Medical Journal* for August 18th, must be read in order that the sequel on "Preventive Medicine in Ordinary Medical Practice," delivered by Dr. Ogle, at the recent meeting of the British Medical Association, may be appreciated at its full value. It will be remembered that in his final paragraph Dr. Ransome invokes supplementary aid from voluntary sanitary associations. While conceding the feasibility of forming such associations, not only in large towns, but in every locality, Dr. Ogle places upon the medical profession itself the responsibility of a deficient public opinion on medical and sanitary questions, and argues that, as preventive medicine is ignored in ordinary medical practice, legislative bodies very naturally ignore the profession when they come to frame laws to prevent the generation and spread of diseases. To establish this position, Dr. Ogle reviews the existing relations between patient and doctor, and concludes that, so far from being in harmony with the requirements of modern medical theory, they are nearly the same as they were when medicine meant physic—that is to say, the physician's claims to remuneration still continue to be based upon the quantity of medicine supplied, and upon material data respecting the number of visits, etc. As such claims—payment per bottle or per visit—take no account of enlightened methods of cure, the public cannot be expected to be wiser than physicians themselves, and to appreciate at their true value curative measures of a different kind. So long, argues Dr. Ogle, as the prevention of disease is ignored in the remuneration demanded for medical services, so long the public will conclude that prevention is not considered by physicians as a part of their work, and the influence of such self-devoted men as Anstie will be lost upon public opinion. As the first step towards realising Dr. Ransome's hopes of more enlightened sanitary legislation, therefore, Dr. Ogle argues that the relations of physicians to the public must be readjusted upon a preventive basis, and draws up a plan of readjustment, which is very simple, although, unfortunately, not exactly practicable in the present state of public opinion. First, the family physician is to stand in the relation of health officer to families employing him, as well as in that of medical attendant in times of sickness, a certain sum per annum to be paid for all ordinary work, prevention included. Secondly, he is to receive supplementary fees for extraordinary visits; the medicines, whenever possible, to be supplied by druggists, or at least to be paid for separately, not as a part of the physician's duties. The stipend per annum, by which the physician is constituted health officer of the family, is to be left to a private agreement between him and his client.

Dr. Ogle states, in concluding his remarks on this aspect of the subject, that the arrangement has been tried and proved practicable and satisfactory, although the where and when of such experiments are not designated, nor are any sufficient details given. Of course, the distinctions between ordinary services and special visits must be sharply made in such arrangements, as ceaseless dispute and litigation must necessarily grow out of any ambiguity, however trifling.

There is no doubt that the work of sanitary police, of boards of health, etc., would be exceedingly simplified by the general adoption of Dr. Ogle's plan, which includes specifications for forming co-operative medical and sanitary societies in every town and village, by way of applying preventive measures to such as cannot afford a per annum stipend or even moderate fees for special services, with dispensaries for supplying medicines, hospitals, convalescent homes, and a fund for procuring expensive instruments that are only wanted occasionally. Organizations of this kind would, Dr. Ogle argues, not only secure the introduction of the newest modes of treatment in country towns and villages, but would also be instrumental in forming an enlightened public opinion upon questions of preventive medicine, and in influencing essential improvements in sanitary legislation.

Whatever may be the case in Great Britain, public sentiment in the United States is not likely for many years to become sufficiently enlightened to admit of a readjustment, upon a preventive basis, of the relations between physician and patient, although the practice of paying the medical attendant a yearly stipend has been adopted by some of our wealthy families. But, as concerns the question of gratuitous services, the idea of a co-operative association in each town may possibly furnish the practical solution of a very knotty problem—one in which the dispensaries and pauper hospitals of our large cities had their origin, but which still troubles the average country practitioner. For example, a co-operative medical and sanitary as-

sociation is practicable in any town having a thousand or more inhabitants, and by means of it the causes of disease among the poorer classes could be reduced to a minimum, thus preventing local outbreaks of fever, diphtheria, etc., etc., and relieving the town from the payment of druggists' bills and fees for medical attendance, as well as the physician from calls for gratuitous service.

MEDICAL CERTIFICATES IN THE DAILY NEWSPAPERS.

In a recent issue of a daily paper of this city still appear the advertisements of the Apollinaris water, with the certificates of prominent medical men attached. It is difficult to understand why this is so in the face of rumors that the names of the majority, if not of all, the medical gentlemen have been withdrawn. If such action has really been taken, it either must have been in a very feeble manner, or else advertising firms must consider that when a gentleman once signs a certificate he loses all exclusive proprietorship of his own name. In any event, the onus of an explanation falls upon the writers of the certificates. That no such explanation is offered would seem to lead to the suspicion that the gentlemen in question despise professional opinion, and are more defiant than repentant. The Committee of Ethics of the Medical Society of the County suggested the course which should have been taken, and advised the withdrawal of the names in question. In fact, that such advice was not anticipated long ago, was a matter of surprise, but now that the gentlemen still permit their names to appear, is almost past comprehension.

INTELLIGENT AND EFFICIENT QUARANTINE.

The report of Dr. Vanderpoel. Health Officer of the Port of New York, to the Commissioners of Quarantine, contains some interesting and suggestive facts. It would appear, as far as these facts will allow us to draw any conclusions, that the problem has been solved of securing effective quarantine at the same time that the interests of commercial circles have been amply considered and satisfactorily protected. Heretofore the existence of yellow fever in the port of New York would have been considered a public calamity, and would have called forth the most strenuous exertions on the part of our health authorities to make the quarantine complete and absolute.

Now, however, we are informed by the Health Officer that the arrival of vessels, having had cases of yellow fever on board, is an event much of the time of weekly occurrence. "During at least five months of the year little or no significance is given to the occurrence, and vessels are given an unrestrained pratique, as if no sickness had occurred." And again, "During the period when the transmission of yellow fever is to be feared, and when the examination of suspected vessels is made, 1,143 vessels were at the station in Lower Bay. Of this number 183 arrived from ports known to be infected; 44 vessels arrived from such ports, having sickness during their stay there, on passage or on arrival here; 140 cases of yellow fever occurred upon them when in an infected port, of whom 36 died; 14 on passage, of whom 12 died; 25 in quarantine, of whom 13 died. Of 7 of the 13 deaths 2 died before reaching hospital and 5 were moribund on arrival at hospital; there were 28 cases in hospital, 25 of which were yellow fever; excluding the 7 above mentioned would leave 18 cases, among whom were 5 deaths, it being about the ordinary percentage for the hospital. The remaining death was from Chagres fever." These are significant facts taken in connection with the statement that no vessels were detained in quarantine longer than for purposes of disinfection, and conclusively prove that sanitary measures and commerce need not be antagonistic, but that the former in this instance was a positive aid to the latter.

This system of quarantine, which was first organized by Dr. Vanderpoel, is for all practical purposes as near perfection as it can be, and after a successful trial of six years in the largest port of entry in the United States it presents itself with all the force of an established principle.

Reviews and Notices of Books.

Essai de Thérapeutique Positive, basé sur l'examen de l'urine, et des produits morbides. Par le Dr. M. Conan. Paris: J. B. Baillière et fils. 1876.

Nouvelle Methode Homœopathique. Par le Dr. Finella. Paris: J. B. Baillière et fils. 1877.

1. We have always supposed that the homœopath's hopes of success in treatment were based on the closeness of the resemblance between the supposed pathogenetic effects of a selected drug and the "symptoms" presented by the patient. In the first of the volumes before us, however, we meet with a new departure, and learn that the proper remedy may be accurately ascertained by a simple examination of the urine if practised in accordance with a method devised by the author. After a preliminary examination of the patient has led the physician to believe that some one of a half-dozen different drugs is the proper one, he makes his final selection by bringing the urinary sediment under the microscope and immediately adding a little of the suspected drug—for instance, a drop of tinc. of bryonia. If no change occurs, bryonia is rejected, and chamomilla, perhaps, is next tried. If now the sediment is wholly *dissolved*, the task is ended and chamomilla selected as all-sufficient. If, however, some of the sediment still resists, a drop of some other medicine is added, and so on until the entire deposit vanishes from view. When this occurs the medicine or medicines necessary to produce this effect are the ones that must be prescribed for the patient whose urine is under examination, and a rapid cure may be confidently hoped for. We cannot but admire the ingenuity of the author, and hope that our homœopathic friends will give the method a fair trial.

2. From the days of Hahnemann to the present time,

the majority of the writers pertaining to his school have claimed as an essential feature of their system the necessity of administering a single drug at a time. At most, they have given a qualified consent to the alternation of remedies. Dr. Finella, however, boldly confronts the difficulties of diagnosis and selection, by collecting the various diseases into classes, as of the eye, skin, lungs, etc., and furnishing formulæ for the preparation of compound specifics for their successful treatment. In most cases, No. 1, or the "specifique préparatoire," composed of eleven ingredients, all in the third dilution, must be employed. In a case of chronic disease of the skin, however, after the preliminary use of No. 1 for a few weeks, No. 19 must be given. This contains nineteen remedies, all in the third dilution, except "*kreosotum*" in the fifth. Other classes of disease have their appropriate specifics. By this means the physician is saved the trouble of an extended examination of his patient, and a wearisome investigation of the materia medica in search of a similimum. Dr. Finella's specifics possess an advantage over those of Humphrey, so well known in this country, insomuch as the formulæ of the former are published.

To be fully appreciated, the two works we have here noticed must be carefully studied.

Reports of Societies.

SURGICAL SECTION OF NEW YORK ACADEMY OF MEDICINE.

Stated Meeting, December 11, 1877.

DR. STEPHEN SMITH, PRESIDENT, IN THE CHAIR.

PERITYPHLITIS AND ITS TREATMENT.

DR. LEONARD WEBER read a paper upon the above subject (*vid.* p. 48).

DR. SANDS stated that he had had somewhat unusual opportunities for the study of perityphlitis, and gave the details of twenty cases of this disease which had come under his observation, nineteen of which had occurred in private practice. An analysis of these cases showed the following results: Resolution occurred in 7 cases; recovered after operation, 8; recovered after rupture of abscess into bladder, 1; recovered after rupture of abscess into rectum, 1; died after abscess had been opened, 1; died after an unsuccessful attempt to reach the abscess, 1; died, without operation, of secondary meningitis, 1.

In reviewing his experience, Dr. Sands remarked that the chances of spontaneous recovery by resolution should never be lost sight of, but ought to be carefully estimated in every case before deciding the question of operation. He could recall several instances in which the symptoms, although characteristic, were mild throughout the entire course of the disease, and never indicated suppuration. Usually the fortunate result had followed the use of opium, leeches, and fomentations, which he regarded as the most valuable means of treatment. In these mild cases, resolution had generally occurred early, at the end of the first or the second week. Occasionally the symptoms, although acute at the onset, had quickly subsided under the treatment above mentioned. In rare instances the disease had run a chronic course without suppuration, one patient having had oft-repeated attacks during a period of five months, and finally recovering without the formation of abscess. In these chronic cases benefit seemed to have been derived from blisters and mercurial inunction. The liability to recurrence after resolution was an interesting fact. One of the patients, a young lady he had seen in consultation with Dr. Draper, had a second attack a year after the first one, both unaccompanied with suppuration. Another had abscess two years after the first attack. A third had three attacks during a period of two years, the last one only terminating in suppuration.

In the case mentioned as having died of secondary meningitis, the abscess, although large, and dependent on perforation of the vermiform appendix, was found, post-mortem, in the lumbar region. It was only suspected during life, and did not reveal itself by the usual tumor in the iliac fossa. In the case in which an unsuccessful attempt was made to reach the abscess, the latter was likewise situated behind the ascending colon, and was caused by a perforating ulcer of the posterior wall of the cæcum. General peritonitis and tympanitis existed at the time when the exploratory incision was made, and rendered the examination of the iliac region difficult and unsatisfactory. If, in such cases, an exact diagnosis could be made, or even if the situation of the abscess could be reasonably conjectured, an incision in the lumbar region would be indicated as in the operation of colotomy.

Dr. Sands had found that, in cases terminating in abscess, the signs of suppuration usually became manifest between the first and second week of the disease. Fluctuation was generally absent during this period, and the formation of matter was indicated by the occurrence of chills or sweating, and especially by a continued elevation of temperature, the thermometer often marking from 101 to 108°. In doubtful cases, he had settled the question by the use of the aspirator. In regard to the proper time for opening the abscess, he thought that no rule could be laid down which would so apply to all cases, and that the urgency of the symptoms, as well as the duration of the disease, should be taken into account. Unquestionably, delay was dangerous, and in the only case he had seen which proved fatal after the abscess had been opened, the latter had attained enormous dimensions, and was not incised until the tenth week. But, on the other hand, the operation might be performed too early, before the abscess was ripe, or before it had approached the surface so as to be accessible. He had once assisted a medical friend who operated, with his concurrence, on the ninth day, but no matter could be found, and eleven days elapsed after the operation before the abscess broke into the wound. Perhaps no harm had come from any of these early operations, and it might be urged that they were of service by dividing the resisting aponeurotic and muscular structures that would otherwise have opposed the progress of matter towards the exterior. Nevertheless, he felt inclined to wait a reasonable period, because then the matter would be more likely to be reached, and because time would thus be afforded for the consolidation and adhesion of the tissues overlying the abscess, without which the fetid contents of the latter would be apt to infiltrate the cellular planes, and occasion sloughing. This he had seen in one instance, and the complication rendered recovery tedious. Of the eight cases that were treated successfully by incision, Dr. Sands himself had operated in five, the remaining cases having been seen in consultation. Excepting the one already referred to, in which the operation was undertaken on the ninth day, they were all submitted to operation between the twelfth and the eighteenth day.

As to the method of operating, Dr. Sands preferred the plan originally practised by Dr. Parker to the modification afterwards proposed by Dr. Buck, although he had found that the external incision need not exceed two inches in length. This having been made parallel with Poupart's ligament, and over the central part of the tumor, the abdominal wall should be cautiously divided to the level of the fascia transversalis, when, by the aid of a hypodermic syringe thrust in various directions, if necessary, the precise situation of the abscess could be determined. A deep incision, half an inch in length, then completed the operation. In one or two instances he had washed out the cavity of the abscess by means of a syringe; in the others it was deemed best simply to insert a tent or a drainage-tube.

Lastly, Dr. Sands stated that he believed there was little danger of wounding the peritoneum during the operation, and that he thought the relations of this membrane to the abscess were often misunderstood. It was commonly held that in perityphlitis due to perforation of the vermiform appendix, the matter was situated in the peritoneal cavity, and the abscess circumscribed partly by coils of intestine, adherent to one another and to the adjacent abdominal wall. But he was certain that this was not the case, and that whenever perforation took place directly into the peritoneal sac, fatal peritonitis speedily ensued. When circumscribed abscess was about to form, he believed that perforation of the appendix was preceded by adhesion of the serous membrane investing the appendix to that lining the iliac fossa, obliterating at that point the peritoneal cavity. Perforation then occurring, the fecal matter or foreign body escaped into the loose connective tissue behind the cæcum, and gave rise to suppuration, which, as it extended, usually stripped off and pushed aside the peritoneal membrane, which therefore would not be endangered by the usual incision made over the most prominent part of the inflammatory swelling. He was confirmed in this view of the pathology of the disease by the result of several autopsies he had either witnessed or heard of, and in all of which the abscess was found external to the peritoneum, being sometimes in the pelvic fascia, sometimes in the loose connective tissue of the iliac fossa, and occasionally in that behind the ascending colon. In no case had he seen a circumscribed perityphlitic abscess in the peritoneal sac.

NEW YORK ACADEMY OF MEDICINE.

Stated Meeting, December 20, 1877.

DR S. S. PURPLE, PRESIDENT, IN THE CHAIR.

RECTAL ALIMENTATION.

DR. AUSTIN FLINT read an interesting paper upon the above subject. The importance of the subject was regarded as sufficient to suggest the question, To whom belongs the credit of having been the first to resort to this method of sustaining nutrition? The author of the paper was not prepared to answer the question. It was Samuel Hood who first suggested it in the present century—in the year 1822. Up to quite a recent date, rectal alimentation had not been regarded as an important measure for sustaining nutrition; at least, only slight reference had been made to it by writers on practical medicine.

Of late, interest in the subject had been somewhat awakened. It had not been altogether because of want of cases, which might show that life could be sustained wholly by rectal alimentation, that such tardiness in recognizing its value had been developed. Reference was then made to a case in which life was sustained for three consecutive months by this means.

A second case was referred to, in which the following clinical facts were made prominent: it was a case of hæmatemesis; exhaustion and exsanguination were very marked. The patient was supported entirely for three weeks by nutritive injections, and the nutritive material was restricted to animal broth, which was tolerated in considerable quantities. Occasional doses of laudanum were added to promote sleep. There was no evacuation from the bowels while rectal alimentation was being pursued. There was a spontaneous evacuation from the bowels, small in quantity, soon after returning to nutrition by the mouth, showing that the nutriment introduced into the bowels had been assimilated.

Reference was made to a third case, in which life was sustained one year and three months by rectal alimentation, and during five years the patient had depended almost entirely upon this method of sustaining nutrition.

Still another case was referred to, in which the patient lived one year under the support chiefly of rectal alimentation.

There were clinical facts sufficient to prove that life could be maintained indefinitely in cases in which recovery was possible, that improvement could be secured in cases in which recovery could not reasonably be expected, and that increase in the weight of the body could be realized by rectal alimentation.

The subject was further studied under three heads:

1. Indications for its use.
2. Appropriate diet to be employed for this purpose.
3. Certain practical rules to be observed.

Rectal alimentation was indicated in obstructions of the œsophagus, the cardiac or the pyloric extremity of the stomach, sufficient to prevent adequate nutrition. It was also indicated in the treatment of gastric ulcer, hæmatemesis, acute gastritis, persistent irritability of the stomach, certain cases of typhoid fever, certain cases of coma, etc.

The kinds of aliment best constituted to form rectal diet was regarded as an important question.

The physiology of the subject was briefly considered in this connection, and it was thought not difficult to understand that, although the aliment met with no digestive juices, the secreting glands, which existed in the large intestine in considerable numbers, might take on a vicarious action when the glands of the stomach and small intestine were not excited into activity by the presence of ingesta.

The idea was also advanced that food introduced into the rectum might excite secretion by the gastric and intestinal glands, and in absence of ingesta in those parts of the alimentary canal, the fluid might pass into the large intestine in sufficient quantity to effect digestion there. Whatever the explanation might be, the clinical fact was well established that digestion of aliment, when placed in the rectum, did take place without the aid of agents which affected digestion outside of the body.

A variety of diet was regarded as better than the persistent use of the same kind of food prepared in precisely the same manner. From analogy, it was reasonable to suppose that such agents as had been found to promote digestion outside of the body might be added to the injections with advantage. Further clinical facts upon that point were needed. The articles now used were meat solution, pancreatic emulsion, Liebig's extract of meat, with or without milk, milk, eggs, mutton and chicken broths. A pancreatic meat

emulsion was mentioned, made as follows: From five to ten ounces of finely chopped meat were added to fully one-third of that weight of the fresh pancreas of the ox, the fat being removed, and mixed with about five ounces of water; the whole was reduced to the consistence of a thick soup.

It was desirable to determine more accurately the affections and conditions in which rectal alimentation was most available, and whether the range of that form of diet might not be extended. Experimental observations upon healthy human subjects would be of interest, and were required. In the cases which had fallen under Dr. Flint's observation, the nutritive injection had not been carried above the rectum. In cases in which the rectum was or became irritable, one-half or a pint of milk could be carried up into the colon and be retained without difficulty. The average quantity of material to be employed in this mode of treatment was from three to six ounces, and the intervals between the injections might vary in length from three to six hours. Small quantities of some preparation of opium might be added to the injection, if they were not well tolerated. It remained to be settled whether or not opium had the same influence upon rectal as upon gastric digestion—namely, to impair it. Preparatory to the beginning of the treatment, the bowels should be emptied either by means of enemata, or by a laxative given by the mouth. As a substitute for drink, when necessary, simple water may be thrown into the bowel, and the surface of the body freely sponged. Alcoholics and medicines might be added to the nutritive injections, or they might be given separately, or they might be used hypodermically. At first, nutritive injections might not be retained, but, if persisted in, they would soon be well tolerated. On the other hand, in some cases they were well tolerated at first, but after a time they were not retained. In such cases it was well to stop them for a short time, when they could probably be renewed with success. It was not thought necessary to wash out the rectum each time prior to using the administration of the nutritive injection. The nutritive injection should be *tepid*. Firm pressure should be made over the anus with a sponge or towel, until the desire to remove the injection had passed away. If the nutritive injections met the requirements of the case, there would follow a sense of comfort and satisfaction the same as after taking a meal in the ordinary way.

The paper being before the Academy for discussion.

Dr. Fordyce Barker gave expression to his own clinical experience regarding the value of this means of sustaining nutrition, by alluding to cases other than those referred to by the author of the paper, in which rectal alimentation could be resorted to with the greatest possible propriety and advantage. There were cases in which paralysis of the muscles of deglutition was developed to such an extent as to preclude the possibility of getting nourishment into the stomach by voluntary action on the part of the patient, and in such instances rectal alimentation might be the means of sustaining life until such paralysis disappeared. Cases of paralysis of the muscles of deglutition as the result of diphtheria were cited, in which nutrition and life were sustained for ten and twelve days wholly by nutritive injections. At the end of that time recovery from the paralysis had occurred to such an extent as to permit the patient to swallow, and ultimate recovery took place. The stomach-tube was used at first, but it soon became impossible to continue its use. Reference was made to a case of paresis of the right side of the body and of the muscles of deglutition, associated with pregnancy and albuminuria. The woman was sustained by rectal alimentation, premature delivery was effected, and good recovery followed.

Reference was also made to a disease which in certain respects resembled what had been described as degeneration of the gastric tubules, but which, so far as his experience went, differed essentially from it, both with reference to its pathology and its results.

While it resembled the disease described as degeneration of the gastric tubules in the fact that there was loss of appetite, nausea, vomiting, progressive emaciation, and rapid development of feebleness, it differed from that disease in certain particulars, as follows: in the first place, all those cases in which degeneration of the gastric tubules and of the glands of the intestines had been found, had occurred in patients somewhat advanced in life. The disease to which Dr. Barker alluded, of which he had seen five cases, had occurred in young subjects, between the ages of 20 and 45.

It was characterized by very excessive vomiting, the quantity of fluid ejected being from two to five times as large as that taken into the stomach, or even from three to six quarts of fluid might be vomited without having taken anything into the stomach. The material regurgitated was usually of a brownish color, was exceedingly offensive, the patients complaining of its pungency; it was acid to the taste, although showing an alkaline reaction. With such vomiting there was rapid emaciation and rapid depression of spirits.

There was absence of all evidence of any organic disease, such as ulcer or carcinoma; there was no tumor, or tenderness, or pains, but simply an excessive regurgitation of fluid from the stomach, as described.

Dr. Barker was of the opinion that in those cases there was no disease of either the glands of the mucous membrane of the stomach or of the intestines, but that it was primarily and essentially a neurotic affection. He was brought to that conclusion by a case in which the patient absolutely refused to be treated by the rectum, but determined to abstain entirely from taking anything by the mouth. This total abstinence, except an occasional swallow of water, was continued for days. At the end of that time the man thought he could take some champagne, and accordingly secured and drank two bottles of iced champagne within a remarkably short space of time, and without producing any deleterious results. From that time he was able to take nourishment by the mouth and retain it, and rapid recovery was made. It was thought that the alcohol and the carbonic acid acted as a sedative to the irritable stomach.

Since that time he had seen three cases, and they were all successfully treated by means of rectal alimentation, with the addition of such doses of anodynes as were necessary to allay all irritation.

With reference to irritability of the rectum such as prevented retention of the nutritive injection, even though opium was added, Dr. Barker had overcome that difficulty by passing the tube high up into the colon, so that the fluid would be thrown into the intestine *above* the rectum.

Dr. E. R. Peaslee regarded the value of rectal alimentation as inestimable. It was sometimes remarked that, if a patient was suffering from some active inflammation, it might be best not to make use of any alimentation at all; it was better for the patient to starve for a time. He was of the opinion, however, that such a view was entirely wrong, and did not believe in it at all; for, if those same pa-

tients, in ordinary health, with a pulse of 65 or 70, and a temperature of 98° or 98¼° F., required a certain amount of alimentation to repair waste of tissues, they required nourishment quite as much when the pulse was 110 or 120, and the temperature 102–3–4–5° F., for the waste of tissue was going on much more rapidly than in health. Dr. Peaslee had acted in accordance with that principle during the past twenty-five years, and if the patient did not retain nourishment when taken by the mouth, no matter whether he had pneumonia, or peritonitis, or any other inflammation, delay was not made more than twenty-four hours in way of trial, before attention was turned towards sustaining the patient, as well as giving proper medicines, by the rectum. If a patient ever required nourishment, it was when he was rapidly being consumed by a temperature of 104° or 105° F. It was thought that we were getting to understand that fact by the treatment of pneumonia now commonly adopted. We now nourished our patients in the best possible manner in the treatment of pneumonia, and the same thing was applicable in the treatment of peritonitis. He would extend this form of alimentation —rectal—very much beyond what had been stated. It could with propriety be used in cases of persistent vomiting, which sometimes occurred in women at about the time of the menopause; in the treatment of the exhausting vomiting of pregnancy; also in vomiting after ovariotomy and in connection with fevers, etc.; in any and every case, if the patient had been twenty-four or forty-eight hours without retention of nourishment taken by the mouth, alimentation should be commenced by way of the rectum. The next question was, What was the proper substance to use for that purpose? That which Dr. Peaslee had employed extensively was prepared as follows: crush or grind a pound of beef-muscle fine; to that add one pint of *cold* water; allow it to macerate three-fourths of an hour, and then gradually raise it to the boiling point; allow it to boil for *two minutes*—no more—and then strain. Dr. Peaslee had sustained a woman ten days by means of injections of beef-tea prepared in that manner, and by beef-tea alone. It should be prepared exactly in the manner described, if all the nutritive elements in the beef were to be obtained. Since the introduction of Leube's pancreatic emulsion, he had employed that preparation. How far up should the material be injected? He had placed it high up in the intestine, but, as a rule, he had not found that it remained so well as when thrown into the rectum. Ordinarily, the irritation produced when the injection was thrown high up into the colon was more than when it was simply introduced into the rectum. That did not militate against the remark made by Dr. Barker, however, because there were cases in which it was better retained when carried high up than when left in the lowest part of the bowel.

The quantity used had been usually three or four ounces every four hours. He preferred to use four ounces and not repeat quite so often.

Why did nutritive material introduced into the rectum sustain the patient?

Dr. Peaslee did not think there was any digestion whatever of the aliment so used. It was important to distinguish between digestion and absorption. Digestion was entirely subservient to absorption. The object here, as in cases of inflammation and fever, when nutrition was sustained by food put into the stomach, was to use nutriment which was already digested, already prepared for assimilation, and which could be at once taken up by the absorbents, either in the stomach and small intestine, or in the rectum, in whichever it might be placed.

Another reason for allowing the nutritive injections to remain in the rectum was because it was much more vascular than other portions of the intestine.

If opium was combined with these injections, absorption was not at all interfered with, but the process of digestion was almost at once arrested by the administration of opium. Reference was made to a single case of gastric ulcer in which life was sustained thirty-one days by rectal alimentation.

Dr. A. H. Smith referred to cases of gastric ulcer in which nutrition had been successfully maintained by rectal alimentation for eleven, sixteen, and twenty-one days. It had occurred to him that defibrinated blood might be employed with success for this purpose. He did not regard what is called Liebig's extract as a reliable article for sustaining nutrition. He was of the opinion that the disrepute which beef tea had fallen into had been greatly engendered by the unsuccessful use of the so-called highly concentrated extracts of meat found in the market.

Dr. Gouverneur M. Smith referred to a case in which there was a most marked increase in the weight of the body as the result of injections of milk alone.

Dr. Peaslee remarked that, so far as his experience went, Liebig's extract so-called was entirely worthless; that Borden's was worth something; but that the only reliable compound of the kind was Leube's emulsion, made after Hoffmann's formula.

The Academy then adjourned.

Stated Meeting, January 8, 1878.

Dr. S. S. Purple, President, in the Chair.

RESIDENT FELLOWS.

Drs. J. H. Edan, G. E. Sussdorf, and Jas. Ciseneros were elected Resident Fellows of the Academy.

BIOGRAPHICAL MEMOIR OF THE LATE GURDON BUCK, M.D.

Dr. Alfred C. Post read a memoir of the late Dr. Gurdon Buck.

Mention was made of the following contributions which Dr. Buck made to the art of surgery:

In 1846 he published a paper in the *American Journal of Medical Sciences* entitled "An Operation for Anchylosis of the Knee-joint." The operation was an original one, and consisted in removing a wedge-shaped portion embracing the condyle of the femur, the patella, and the articular surface of the tibia.

In 1848 he read a paper before the American Medical Association in which he brought forward "Scarification as a Means of Treatment in Œdematous Laryngitis."

In 1853 he read a paper before the same Association "On the Surgical Treatment of Morbid Growths within the Larynx."

In 1855 he read an elaborate paper before the New York Academy of Medicine "On Badly United Fractures of the Thigh."

In the same year he published a paper in the *New York Medical Times* "On the Treatment of Deep Wounds of the Parotid Region." The operation, resorted to for the control of hemorrhage in the case reported, was an original one, and consisted in ligation of the primitive and also the internal carotid arteries.

In 1857 he published a paper in the *New York Journal of Medicine* "On the Treatment of Post-facial Abscess in the Iliac Fossa."

In 1861 he read a paper before the New York Academy of Medicine "On an Improved Method of Treating Fracture of the Thigh." The method brought forward was that of continuous extension by means of adhesive plaster, weight and pulley, and commonly known as "Buck's Extension Apparatus."

In 1867, at the International Exhibition at Paris, a model of this apparatus was entered, and Dr. Buck received a diploma and medal as a testimonial to its great value as a means of treating fracture of the thigh. The idea, however, did not originate with Dr. Buck. The principle of continuous extension had been illustrated by Dr. H. G. Davis in his apparatus for the treatment of morbus coxarius, and it was through him that Dr. Buck became acquainted with the appliance. To Dr. Buck, however, the credit should be given for utilizing the principle in the treatment of fracture of the thigh, and for bringing it prominently before the profession.

In 1869 Dr. Buck read a paper before the Medical Society of the State of New York "On Lithotomy and Lithotrity," and gave the results of operations for the relief of *fifty* cases of stone in the bladder.

In 1872 he published a small volume upon the same subject.

In 1876 he published a small-sized octavo volume "On Reparative Surgery," in which is given his experience in treatment and the operations performed for the relief of deformities produced by burns, gunshot wounds, and other injuries.

The life of Dr. Buck was held up as a model to young men, because it illustrated how much could be accomplished by a steady and uncompromising struggle towards an honorable position in his chosen profession. A fitting tribute was paid to the memory of Dr. Buck as a Christian gentleman.

TO THE MEMORY OF DR. KILBOURN.

Resolutions of respect to the memory of Dr. Kilbourn were read by Dr. Garrish.

ELECTION OF OFFICERS.

The President announced the election of officers as follows:

For Vice-President—Dr. T. G. Thomas. *For Trustee*—Dr. E. R. Peaslee. *For Treasurer of Board of Trustees*—Dr. J. R. Leaming. *For Committee on Admission*—Dr. E. Eliot. *For Committee on Ethics*—Dr. O. White. *For Committee on Education*—Dr. A. C. Post. *For Committee on Library*—Dr. J. Wiener. *For Delegates to the New York State Medical Society*—Drs. J. C. Peters, W. T. White, E. D. Hudson, Jr., T. G. Thomas, and F. A. Burrall.

The Academy then adjourned.

Correspondence.

HOW TO SUPPRESS QUACKERY.

To the Editor of The Medical Record.

Sir:—Your issue of January 5th contains an editorial headed "Albany Ethics, and how to suppress Quackery." To those who, like myself, are regular readers of your valuable journal, the tenor of the article in question was neither surprising nor new, as it forms, in spirit, but one of a series. While no one, however, can gainsay the justness of your views, the solution of the question, "Is the suppression of quackery possible?" remains as remote as ever. Thus far neither legal enactments nor professional ostracism have succeeded in protecting the public from unqualified practitioners, either general or special. I therefore beg leave to suggest a plan—based on the assumption that the public would employ qualified in preference to unqualified practitioners, *if only they knew which is which*—that seems to me likely to remedy the existing evil—if not entirely, at least to a great degree. This is, *to furnish the public, through the medium of the daily press, a more or less extensive list of regular practitioners and specialists.* The manner in which this may be done is very simple. The County Medical Society ask the leading daily papers to set apart a space—as much as may be required from day to day—headed, "List of Physicians recognized by the Medical Society of the County of New York;" under this head the respective papers to bind themselves to receive no advertisement that is not endorsed "*approved*" by the chairman of a committee (either that on ethics or a special committee) appointed for the purpose by the Society. This advertising space, then, is to be set apart exclusively for such advertisements, approved in the manner above described, as any physician in regular standing chooses to pay for. These advertisements are, of course, subject to certain restrictions. To limit them, however, to the simple name, address, and hours would, while sufficient in the case of the general practitioner, be inadequate where the specialist is concerned. The object being to furnish a guide to the public, it must be permitted to state the specialty to which a physician devotes himself (as permitted also in Europe), without, however, holding out any special inducements. (I would here state that, so far as my own individual opinion goes, no one ought to be endorsed as a specialist who has not, by writings, lectures, dispensary work, or in some other satisfactory manner, established a fair claim to his specialty; in other words, there should be no "self-constituted" specialists.) Should a sufficient number of both classes of advertisements offer, the respective papers might conveniently subdivide the space under the respective heads of "General Practitioners" and "Specialists."

While it may be urged that such a list would furnish but a very incomplete register or guide for the public, it would, on the other hand, tend to stamp all medical advertisements *not* under this head as those of irregular practitioners or quacks.

To make the proceeding more complete, I am in favor of having the following *standing* advertisement heading the list (the expense would, I am sure, be cheerfully borne by the profession of our city, whom, if divided *pro rata*, it would cost but a few shillings each annually): *The Medical Register, containing a list of all New York physicians in regular standing, can be seen at* —— (here mention several prominent drug and medical book-stores).

Should my plan be adopted, it would, in addition to the suppression of quackery, subserve another end. You have frequently, in your editorial columns, animadverted on the advertising propensities as well as facilities of certain professors. This discrimination against the untitled members of our profession would be effectually neutralized by the adoption of my plan, which would enable untitled and young physicians to compete with the more privileged on a fairer basis than is possible at present. The elaboration and details of the plan would of course fall to the County Society. Yours very respectfully,

Geo. M. Schweig.

New York, January 10, 1878.

A NEW HIGH-POWER LENS.

To the Editor of The Medical Record.

Sir:—The high importance of any improvement or new form of construction tending to augment the value of the microscope as an instrument for medical investigation, emboldens me to ask for a paragraph or two in your overcrowded journal, by way of bringing to the notice of the profession a new objective invented and arranged by myself. Its merits are, that it introduces the condenser as a part of the objective, and thus converts to practical purposes a hitherto-neglected source of illumination, and that it multiplies the power in diameters by five, and in magnitudes by twenty-five, of any objective to which it may be applied, without in the least diminishing its working distance. A $\frac{1}{10}$-inch Bardou objective, once mentioned in the Record for remarkable defining and penetrating properties, forms the basis of the new lens. With one of Pike's medical stands, **C** eye-piece, and a long and slender adapter constructed from the tube of a small continental instrument, the unmodified lens has given me a power of 1,500 diameters. With all its original excellence of definition, and with a sufficient working distance so that thin covers can be used, the same lens, as at present arranged, gives by micrometer measurement the extraordinary power of 7,500 diameters, with the assistance of a $\frac{1}{8}$-inch condenser introduced as a part of the sub-stage—a power at which the common monad found in perspiration, saliva, and secretions and excretions, can be studied as to details of structure and classification. The diameter of the field at this power is exactly spanned by three blood-corpuscles arranged in linear series; and yet the field has no central depression or cloud, and each corpuscle lies accurately and exactly defined under the eye. By using this modification, with a good $\frac{1}{4}$-inch lens, upon a stand of ordinary construction, the medical investigator may obtain all the results obtained by a $\frac{1}{20}$-inch lens, without any of the inconveniences incident to the use of such lenses.

Francis Gerry Fairfield, A.B., Ph.D.,
Prof. Microscopy and Micro-chemistry,
New York College of Veterinary Surgeons.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from January 6, to January 12, 1878.

Storrow, S. A., Major and Surgeon. Assigned to duty at Fort Laramie, Wy. T. S. O. 1, Department of the Platte, Jan. 2, 1878.

Waters, W. E., Capt. and Asst. Surgeon. To return to San Antonio, Texas, and report in person to the Commd'g General Dept. of Texas for assignment to duty. S. O. 4, A. G. O., Jan. 4, 1878.

Elbrey, F. W., Capt. and Asst. Surgeon. Assigned to duty at Oglethorpe Barracks, Savannah, Ga. S. O. 208, Dept. of the South, Dec. 27, 1877.

Paulding, H. O., 1st Lieut. and Asst. Surgeon. Granted leave of absence for one month with permission to apply for three months' extension. S. O. 1, Dept. of Dakota, Jan. 2, 1878.

Finley, J. A., 1st Lieut. and Asst. Surgeon. Leave of absence extended two months. S. O. 5, A. G. O., Jan. 5, 1878.

Good Samaritan Hospital for Diseases of the Rectum.—An hospital and dispensary, with the above name, has been established in this city. The following constitutes the medical board: Consulting Surgeons, Drs. Willard Parker, William H. Van Buren, Frank H. Hamilton, and Henry B. Sands; Surgeon, Dr. Edward J. Bermingham. This staff will be increased from time to time, as the requirements of the institution may demand, by the appointment of assistant surgeons.

To avoid the abuse of this charity, the managers have decided to adopt the "Provident System," as the following extract from their by-laws will show:

"No member of a family whose income is over ten dollars a week shall be entitled to gratuitous treatment. Those families whose income is between ten and fifteen dollars per week, shall be required to pay ten cents per week while under treatment in the dispensary department. Where the income is over fifteen dollars, but does not exceed twenty dollars, they shall be required to pay twenty cents per week. Where the income exceeds twenty dollars per week, the rate per week shall be fixed at the discretion of the surgeon. All moneys received from this source shall be handed to the treasurer at the end of each month."

Death of Mr. Thomas Treganowan.—At a meeting of the students of the College of Physicians and Surgeons, held January 8, 1878, a committee was appointed to present resolutions respecting the death of Mr. Thomas Treganowan, of South Amboy, N. J., a student of the college, who was suddenly killed on New Year's day while crossing the railroad at Menlo Park, N. J. The committee respectfully report as follows:

Whereas, We have heard with surprise and deep regret of the sudden death of our fellow-student in medicine, Thomas Treganowan, and

Whereas, We would ever bow to an All-wise Providence, which has thus so unexpectedly removed from our midst our esteemed friend and kind-hearted brother, who but a short time since was so full of life and ambition, and who gave rare promise of being an honor to, and a devoted servant in, the profession he had chosen for his life-work; therefore

Resolved, That we will ever cherish his memory with respect, at the same time expressing our profound sorrow at his early death.

Resolved, That we extend our sincere and heartfelt sympathy to his bereaved parents and relations.

Resolved, That a copy of these resolutions be transmitted to his parents, and also be published in The Medical Record.

W. P. Watson,
E. W. Crater,
C. P. W. Merritt, } *Committee.*

WILLIAM WOOD & CO., Publishers, 27 Great Jones Street New York.

☞ SUPERIOR TO THE PEPSIN OF THE HOG.

INGLUVIN

FROM THE

Ventriculus Callosus Gallinaceus.

A specific for VOMITING IN PREGNANCY, a potent and reliable remedy for the cure of INDIGESTION, DYSPEPSIA, and SICK STOMACH, caused from debility of that organ. It is superior to the Pepsin Preparations, since it acts with more certainty, and effects cures where they fail.

"A New Remedy, INGLUVIN."

By A. F. SHELLY, M.D., of Philadelphia.

"This is obtained from the gizzard of the domestic fowl (chicken), and is a ***Specific for Vomiting in Pregnancy.*** I have used this remedy for twenty-five years, and it has never failed. It is also the most ***powerful*** and ***reliable remedy*** for the ***Cure*** of ***Indigestion, Dyspepsia,*** and ***Sick Stomach,*** caused from debility of that organ. It is useful in all cases where pepsines and pancreatines are used, but with much more certainty of good results.

"In complicated affections of the Stomach, such as ***Inflammation, Gastralgia, Pyrosis,*** etc., it may be combined with Subnitrate of Bismuth and opiates; and in Diarrhœa and Cholera Infantum, with astringents, both vegetable and mineral. I have given the article to several prominent physicians, who have used it with the happiest results, among whom I may mention Prof. E. WALLACE, of the Jefferson Medical College."

Physicians prescribe this remedy in doses of 5 to 10 grains after meals, in water, or with teaspoonful vinegar and water. In cases of sickness in pregnancy, 10 grains every three hours.

AN EFFICIENT REMEDY AND AN AGREEABLE SUBSTITUTE FOR COD LIVER OIL.

PROF. TROUSSEAU'S

CARBONIZED

FRESH MEAT CURE

Consisting of TENDER, RAW, LEAN BEEF, desiccated in vacuum, combined with CARBON as an antiseptic, and medicated with HYPOPHOSPHITES OF LIME, SODA, and POTASSA with CINCHONA. A medicated, nourishing food, pleasant to take and easily digested, for the cure of

Consumption, Chronic Dysentery, and Exhausted Conditions consequent upon Typhus and Typhoid Fevers, Typhoid Pneumonia, Diphtheria, General Debility, Nervousness, and Prostration from whatever cause.

DIRECTIONS FOR ADMINISTERING.—Physicians in prescribing this remedy give one to four teaspoonfuls four times daily, in milk, wine, or malt extract, but it is so pleasant that it can be taken dry on the tongue.

WILLIAM R. WARNER & CO., Manufacturers of Sugar-Coated Pills,

1228 Market Street, Philadelphia.

In corresponding with Advertisers please mention **The Medical Record.**

ALWAYS SPECIFY "K. & M." GRANULATED EFFERVESCENT SALTS.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

MESSRS. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen,—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KERN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

MESSRS. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

MESSRS. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

K. & M.

Granulated Effervescent Preparations

Of Magnesium Citrate, Potassium Bisarb., Citrate, Benzoate, and Bromide; Lithium Benzoate and Carbonate; Cerium Nitrate and Oxalate; Bismuth Citrate (SOLUBLE), Pepsin, and Bismuth; Pepsin, Bismuth, and Iron, etc., etc., etc.; also the following

CHAMPION SPOUTING SPRING NATURAL WATER
FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For ***Headache,*** or disordered state of the Stomach arising from the use of wines or hearty eating it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*
Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.,** or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.

Dr. Garratt's Constant Electric Disks,

That any person may apply and wear with comfort for relief of local *pains* and *weakness*; for old Rheumatic and Neuralgic pains, coldness and stiffness. It is also remarkable for its constant power to help Weak Lungs, Heart, Stomach, Kidneys, Sluggish Liver, Lame Back, and other ills.

While worn, by night or day, this flexible pad is self-charging and applies a fine, constant galvanism that wonderfully cures nervous ills. For the price and purpose, it has no equal. So say physicians, druggists, and those now using this improved electric. Large Disk, $2.50; Children's Disk, $1.00; Long Disk, with straps for the body, $3.50; Do. for large body, $5. Can be sent by mail on receipt of price, by GARRATT & Co., 6 Hamilton Place, Boston, Mass.

HUNGARIAN WINES

EVER BROUGHT TO THIS COUNTRY.

STRICTLY FOR MEDICINAL USE.

Respectfully informs the members of the Medical Profession that he has opened an office at

13 West 11th St., New York.

Those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES**, which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:

NEW YORK, *April* 10, 1877.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. Reich and his Wines to our professional brethren.

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL, and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist.

Explanatory Circular mailed on application.

(P. O. Box 4,517), 2 and 4 Platt Street, New York

LOEFLUND'S EXTRACT OF MALT

Is recommended to physicians for its **purity** and **superiority** over all others. It is perfectly free from **Alcohol, Carbonic Acid and Empyreumatic Products**, which can only be attained by the **most careful manipulations** in its manufacture, **long experience**, and by means of **unexcelled apparatus**. Mr. Ed. Lœflund, of Stuttgart, Germany, manufactures only Malt preparations, devotes his whole time to these; and being a thorough Chemist, makes a preparation based upon **scientific principles**. For this reason his Preparations were awarded a **prize** at the **Centennial Exhibition. Lœflund's Concentrated Extract of Malt** is a **Resolvent Emollient** and most powerful **Nutrient**. It is used for diseases of the **respiratory organs, pulmonary complaints**, and for diseases originating in **imperfect digestion**. **Price per bottle, 75 cents.**

Lœflund's Extract of Malt with **Pyrophosphate Iron.**
" " " **Citrate Iron and Quinine.**
" " " **Iodide Iron.**

Lœflund's Extract of Malt with **Hypophosphite Lime.**
" " " **Pepsin.**
" " " **Hops.**

Each of these **$1.00 per bottle.**

Lœflund's Concentrated Leibig's Food for Infants (Leibig's Soup for infants in a concentrated form), **ready for use**, has been pronounced by the Judges of the Centennial Exhibition: **A perfect Substitute for Mother's Milk**, and therefore awarded a prize. Price, 75 cents per bottle.

Circulars giving full particulars will be mailed to all parts upon application.

CAUTION TO THE TRADE AND PUBLIC.—The labels on Lœflund's Preparations should be carefully examined. The signature of ED. LŒFLUND appears on the right lower corner of the genuine label; in the centre, the *Trade-Mark*; and on the *left lower corner*, the words: Sole Agent for America, ALBERT C. DUNG, Druggist, 61 Bowery, New York.

The genuineness of these only is guaranteed. All labels are printed in the *English Language*.

Lœflund's Extract of Malt Lozenges contain a large proportion of **Extract of Malt**, and are **very efficacious**, as well as highly agreeable **Cough Lozenges**. Price 25 cents per package.

All the above preparations are kept by the leading druggists. Orders by mail promptly filled by

ALBERT C. DUNG, 61 Bowery, New York.

NEW HYPODERMIC SYRINGES.

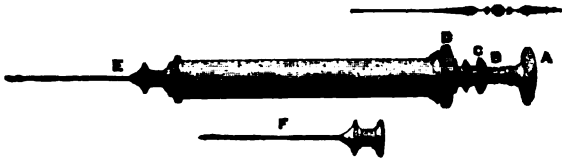

Fig. 48.—No. 2.

These cuts (two-thirds the actual size) represent a New Hypodermic Syringe of our Manufacture. With the exception of the needles, it is of German Silver, a material chosen as possessing, next to steel, the greatest rigidity and durability, while free from liability to oxydation. The barrel is formed by a process peculiar to ourselves, securing uniformity of calibre without soldered joint or seam. It is plated inside and outside with nickel. The piston is packed in the double parachute form, with leather prepared expressly for the purpose. It will be found to retain its elasticity, to operate smoothly, to resist all tendency of fluid to pass above, as of air below it. A nicely-engraved scale upon the piston-rod indicates minims, thirty being the capacity of the syringe.

Syringes Nos. 2, 3, and 4 have also a screw thread upon the piston-rod, and a traverse nut, thereby favoring the utmost nicety in the graduation of doses.

No. 3, Compact, has hollow piston-rod to receive one needle, also a protecting cover and fluid retainer; it may be carried in the Pocket Instrument or Vial Case, or without any case.

No. 4, Compact, is like No. 3, with the addition of a second needle, carried upon the syringe in the usual place, protected by a metal shield.

Nos. 1 and 2 are put up in neat morocco-covered case, with vial.

Two sizes of needles are furnished with each instrument, Nos. 1, 2, and 4; one only with No. 3. They are of refined steel, carefully tempered, and thoroughly plated with gold; they are of small diameter and large relative calibre, sharpened to such an angle as will offer least resistance to penetration, and therefore cause least pain. At the point of union with the socket they are reinforced with an outer covering of German silver, thereby overcoming the tendency to become broken at this place. They are connected with the barrels by a screw thread.

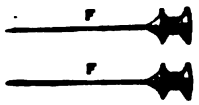
Prices: No. 1, **$4.00.** No. 2, **$4.50.** Postage, .03.
" No. 3, **3.00.** No. 4, **4.00.** " .02.

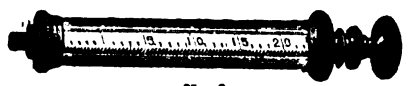
No. 3.

These Syringes are so thoroughly and strongly made as to be free from the annoying accidents common to most Hypodermic Syringes; and we believe that for convenience, durability, and nicety of construction, they have no superior.

OTHER HYPODERMIC SYRINCES.

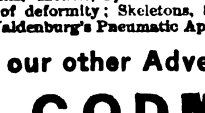
		Postage.
No. 7, glass-barrel, graduation engraved on barrel, with screw nut on piston, nickel-plated mountings, two best steel gilt needles, in neat case,	**$3.00**	.02

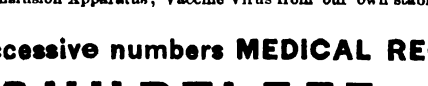




No. 9.

		Postage.
No. 9, glass, graduation engraved and numbered on piston-rod, with screw nut, two best steel gilt needles, in neat case,	**$3.00**	.02
No. 7 or No. 9, with two steel unplated needles, either,	**2.50**	.02
No. 10, glass, Luer's (French), graduation as No. 9, one gold needle and two steel needles, silver mountings, neat velvet-lined morocco case,	**12.00**	.02
No. 11, glass cylinder, fenestrated, nickel-plated metal mounting (see cut).		





No. 11.

As represented in the cut, the glass cylinder is encased in a metal mounting, fenestrated to show the graduations for minims. The instrument may readily be taken apart for cleaning, and, for those who prefer glass, is recommended for its non-liability to breakage. Price, with two best steel gilt needles, in a neat case, **$3.50** *Postage.* .02

☞ *Any of the above will be sent by return mail on receipt of price and postage.*

HYPODERMIC SYRINGES OF ALL KINDS PROMPTLY REPAIRED.

TO PHYSICIANS.

THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, i. e., the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving resules of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops,** viz.: Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT,			**With Hops (Plain),**	**$1 00**

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. It's physiological action insures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of **CASWELL, HAZARD & CO., New York,** and of all respectable Chemists throughout the world.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

LAZELL, MARSH & GARDINER'S
POWDERED
MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts*.

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

FOUGERA'S COMPOUND IODINIZED
COD LIVER OIL

Since the introduction of this oil in 1858 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine, and Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each. DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,

GALVANIC BATTERIES,

BATH APPARATUS, &c.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8½ x 7½ x 4½. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

Hunyadi János Mineral Water

THE BEST NATURAL APERIENT.

THE LANCET.

"HUNYADI JANOS.—Baron Liebig affirms that its richness in aperient salts surpasses that of all other known waters."

THE BRITISH MEDICAL JOURNAL.

"HUNYADI JANOS.—The most agreeable, safest and most efficacious aperient water which has been brought under our notice."

From Prof. MACNAMARA, Prof of Materia Medica, Royal College of Surgeons in Ireland; Editor of "Neligan's Medicines, their Uses," &c., 7th edition.

"Far the most valuable and palatable of our Aperient Mineral Waters. I have been most agreeably surprised with the result of a clinical investigation."

From Professor AITKEN, F.R.S., Professor of Pathology, Army Medical School; Author of the "Science and Practice of Medicine," 6th edition.	"Those who have used Pullna and Friedrichshall prefer the Hunyadi János Water to either, because the bulk of the dose is less than either of those waters, and the action is less drastic, producing no distress or uneasiness."
From Professor T. LAUDER BRUNTON, F.R.S., Professor of Materia Medica and Therapeutics at St. Bartholomew's Hospital; Examiner in Materia Medica, University of London.	"More frequently prescribed than any other by Physicians in the General Hospital, Vienna: its taste being more pleasant than that of its rivals, while its efficacy as a purgative equaled or surpassed theirs."
From Professor Dr. VIRCHOW, Director of the Pathological Institute, Berlin.	"I have tried the Hunyadi János water sent me on a large number of persons, with invariably good and prompt success. It is a most valuable item in our Balneological treasury of remedies."
From Professor Dr. von HAMBERGER, Director of the Medical Klinik in the University of Vienna.	"I have prescribed the Hunyadi János waters with remarkable success in all those diseases for which aperient waters are used."
From Professor Dr. SCANZONI (von LICHTENFELS), Professor of Medicine in the University of Würzburg.	"After having made a large number of experiments extending over many years, I prescribe none but this."
From Dr. J. MARION SIMS, Consulting Surgeon of the Women's Hospital, New York, Honorary Fellow of the Obstetrical Societies of London, Dublin and New York.	"As a laxative, I prefer the Hunyadi János to any and every other mineral water, and for the following reasons: The dose is small; the taste is not unpleasant; it acts promptly; it does not oppress the stomach; it does not gripe, and it is efficient."
From Dr. FORDYCE BARKER, Professor of Clinical Midwifery and Diseases of Women, Bellevue Hospital, New York.	"It requires a less quantity: that it is less disagreeable to the taste: less unpleasant in its efficient action, and more certain as an aperient, than any of the waters that I have before been accustomed to prescribe."
From Dr. von BUHL, Professor of Medicine in the University of Munich.	"Among all known aperient waters, the Hunyadi János water indisputably occupies the first position."
From Dr. JAMES R. WOOD, Emeritus Professor of Surgery in Bellevue Hospital Medical College, and Surgeon to Bellevue Hospital, New York.	"It is generally a certain but gentle and painless aperient. In my experience it is superior to any other Bitter Water."
From Dr. WILLIAM A. HAMMOND, Professor of Diseases of the Mind and Nervous System in the University of the City of New York.	"According to my experience, the most pleasant and efficient of all purgative mineral waters."
From Dr. ALFRED L. LOOMIS, Professor of Pathology and Practice of Medicine in the Medical Department of the University of the City of New York; Visiting Physician to Bellevue Hospital.	"The most prompt in its action and the most efficient of any of the aperient mineral waters. Specially adopted to those persons who daily require the aid of cathartics."

For ordinary aperient purposes a half wine-glassful of the Hunyadi Water may be taken at bed-time, or a wine-glassful taken in the morning fasting. It is most efficacious when warmed to a temperature not below 60° or when an equal quantity of hot water is added to it.

Every genuine bottle bears the name of the Apollinaris Co., Lim., London, England.

MAY BE ORDERED OF ALL DRUGGISTS, GROCERS & MINERAL WATER DEALERS.

SOLE AGENTS FOR THE UNITED STATES AND CANADA,

FREDERICK de BARY & CO., 41 and 43 Warren St., New York.

APOLLINARIS WATER.

From R. OGDEN DOREMUS, M.D., LL.D.,

Professor of Chemistry and Toxicology in Bellevue Hospital Medical College and Professor of Chemistry and Physics in College City of New York.

Last Summer our Croton Water was remarkably polluted. It teemed with animalculæ; its odor was uninviting; its taste was unpalatable; and its effects upon the system unwholesome. Unfortunately this has occurred each warm season, and will happen in a more or less marked degree every Summer.

It is well known that many cities suffer from impure water.

Eminent physicians in Albany attribute the increased sickness and mortality in the capital of our State to the water supplied from the Hudson River.

In rural districts, the drainage from the residence frequently contaminates the well water to such an extent as to produce prostration and death. Many ingeniously devised filters have been presented to the public; they are effective in removing certain objectionable particles, but the impurities of the most vital importance still remain.

The delusion applies also to aerated waters, which to the eye appear transparent and sparkling, yet at times are magazines of disease.

I find on careful examination that the *Apollinaris Water is entirely free from all such organic impurities.*

Its freedom, also, from metallic poisons already referred to enables the chemist to coincide with eminent medical authorities in commending it as an *absolutely pure, wholesome, as well as pleasant mineral water, superior to all others as a daily beverage.*

APOLLINARIS WATER—"Far superior in flavour and quality to ordinary manufactured aërated waters, and useful in preventing gouty and dyspeptic disorders."—*The Practitioner.*

APOLLINARIS WATER—"The favoured drink of the favoured classes."—*London Medical Record.*

APOLLINARIS WATER—"An article of diet, alike refreshing, agreeable, and of great value."—JAMES PALFREY, M.D., Obstet. Physician to London Hospital, etc., etc.

APOLLINARIS WATER—"Exhilarating; good for loss of appetite, nausea, and dyspepsia."—*Companion to the British Pharmacopœia*, by PETER SQUIRE, F.L.S., Chemist to the Queen.

APOLLINARIS WATER—"Incomparable for mixing with Wines and Spirits."—H. VIZETELLY, British Wine Juror at the Vienna Exhibition.

APOLLINARIS WATER—"Far superior to ordinary aërated Waters."—*Medical Times and Gazette.*

APOLLINARIS WATER—"Highly estimated by those who have made Aërated Waters a study."—*Medical Press.*

APOLLINARIS WATER—"The type of purity."—Professor BARTLETT, F.C.S.

APOLLINARIS WATER is strongly recommended by Dr. PETER HOOD, as superior to Vichy and Vals."—*Treatise on Gout and Rheumatism.*

APOLLINARIS WATER—"I have used the water myself for above a year and a half. It is a most refreshing beverage, highly restorative, and well adapted to relieve most of the dyspeptic constitutions that English stomachs are so peculiarly liable to."—JAMES BIRD, F.R.C.S.

APOLLINARIS WATER—"The water contained in the glass bottle, doubly charged, is, in my opinion, far superior to the seltzer water supplied to us in England. For dyspeptic, rheumatic, and gouty subjects, I consider it a very valuable beverage, taken either with sherry, brandy, or gin."—G. BORLASE CHILDS, F.R.C.S., Surgeon to the City of London Police.

APOLLINARIS WATER—Dr. Hermann Weber, F.R.C.P., writes:—"Having largely used it during the last seven years, I have found it of great value as an article of diet in gouty dispositions, in lithic acid diathesis, in tendency to gallstones, in some forms of catarrh of the bladder, and in chronic catarrh of the respiratory organs; in the latter, either treated by itself or mixed with hot milk or hot whey. To many persons the Apollinaris forms an agreeable and useful addition to bitter waters, and a good vehicle for some medicines."

APOLLINARIS WATER—"I have personally derived immeasurable advantage from the use of Apollinaris Water, and I have recommended it in my professional capacity very largely to my patients. Its use to myself has been most remarkable, and the testimony of very many to whom I have suggested its use is highly eulogistic of its effect upon them."—GEORGE TATHAM, M.R.C.S., England; L.S.A., J.P., Brighton, formerly Surgeon North Devon Hospital.

APOLLINARIS WATER—"A pleasant beverage, agreeably effervescent, and tenacious of its gas. It is also a very safe and gentle antacid. I hope it will meet the popularity it deserves."—JAMES MORRIS, M.D., London, Fellow of University College.

FOOD IS THE BEST TONIC!!

TRADE MARK.

MENSMAN'S

PEPTONIZED

BEEF TONIC.

The great necessity for a fluid food that would possess **all the elements necessary for the support of the system**, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared for us by reliable and competant parties after a thoroughly tested and scientific method.

PROPRIETORS,

CASWELL, HAZARD & CO.,

DRUGGISTS AND CHEMISTS,

Fifth Ave., cor. 24th St.; & Sixth Ave., cor. 39th St., New York.

PARVULES.

MINIMUM DOSES FOR CHILDREN AND OTHERS.

At the solicitation of our medical friends we have prepared this new class of preparations, denominated **PARVULES** to distinguish them from **Pills** and **Granules**. They are designed for the administration of medicines in minute doses for children, and for frequent repetition in case of adults. It is claimed by some practitioners that small doses given at short intervals exert a more curative effect.

☞ THESE ARE NOT INTENDED TO SUPPLANT THE USE OF PILLS AND GRANULES. ☜

NOTICE.—See our Advertisement, page 8.

Extract of Malt

WITH

COD LIVER OIL.

Our Improved Extract of Malt with 50 per cent of our fine Norwegian Oil, is pre-eminently THE emulsion of Cod Liver Oil, since it *has double the nutritive effect of any other emulsion of oil.* It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or gramiaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that IT UNITES PERFECTLY WITH WATER IN ANY PROPORTION, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

DOSE.—A Dessert to Tablespoonful immediately after Meals.

Prepared with the most scrupulous care

KEASBEY & MATTISON,

MANUFACTURING CHEMISTS,

☞SEND FOR PAMPHLET ON MALT AND NEW REMEDIES.☜

RIGOLLOT'S PAPER

is not (as certain storekeepers of bad faith pretend) a production that any one can make;

RIGOLLOT'S PAPER

is not manufactured with a mustard that every one can buy;

RIGOLLOT'S PAPER

is one of the most marvelous discoveries of the contemporary pharmacopœia:

RIGOLLOT'S PAPER

is the invention of Mr. P. Rigollot, who is the exclusive owner, and is the only preparation of the kind which obtained a medal and diploma at the Philadelphia Exposition. It is sold wholesale at

No. 24 AVENUE VICTORIA, PARIS.

ALL OTHER MUSTARD LEAVES

which do not bear the signature of P. Rigollot are but IMITATIONS of his remarkable invention, and

SHOULD NOT BE BOUGHT.

RIGOLLOT'S PAPER

is the only one adopted by the Civil and Military Hospitals throughout the whole of Europe.

To be had of all the principal Chemists and drug stores in the world.

INSIST THAT THE SIGNATURE is on each leaf.

P. Rigollot

DR. FRIEDR. WITTE,

Rostock, Mecklenburg,

Begs leave to announce to the profession and drug trade that he has given the sole agency for his goods for the U. S. and Canada to

Mr. F. ALFRED REICHARDT.

I have now a supply of Dr. Witte's goods on hand; they are the most reliable made in Germany, and his preparations of Pepsin, Ptyalin, etc., have taken the first place there *over all others.*

Pepsin, plain, soluble,	1 gr.,	dissolves	100 grs.	of Albumen,	*Per doz.*,	$1 25
Ptyalin,	1 "	"	100 "	Boiled Starch,	"	1 25
Ptyalin Pepsin,	1 " and	"	100 "	" Fibrin,	"	1 25
Resin, Scammony from Root, powd.,					*Per oz.*,	60c.
Extr. Cannabis Indic, superior to English, 2 oz. jars,						35c.
" Colocynth, simple (imported to make Ex. Coloc. Comp.),						60c.
" Taraxaci, in 1 lb. porcel. jars,						80c.
" Ferri Pomate, " " "						$1 00

Prices inclusive of jars and bottles.

MATHIAS ROZSNYAY,

Arad, Hungary,

Begs leave to inform the Medical Profession that he has given his sole agency and the exclusive control of his preparation of

TASTELESS QUININE,

Neutral Tannate of Quinine,

To Mr. F. ALFRED REICHARDT, who keeps full stock of his preparations.

The discovery of Mr. Math. Rozsnyay to make an *absolutely tasteless and reliable* preparation of Quinine is one of the most important in modern therapeutics. The ordinary Tannate of Quinine, as made in chemical works, is obtained by precipitating the mother liquor, of which Quin. Sulphate has crystallized out, by an addition of Tannic Acid. First, this is an acid or bi-tannate, and contains likewise all the other Cinchona Alkaloids. Quinidia, Cinchonidia, Cinchona, Quiniodin, etc., the little intrinsic value of which is best proven by the price lists of large German manufacturers who quote this salt at only one-sixth of the value of the Sulphate. The *neutral* Tannate of Quinia has also great advantages over the Sulphate, as it does not cause the same cerebral and digestive troubles, as has been fully proved by the report of the commission appointed by the Academié de Medicine, in Paris, on a memoir presented by Mr. Bonesiera. The commission consists of Messrs. Orfila, Busey & Bouvier; their names are sufficient proof for the thoroughness of their researches.

I guarantee that this Neutral Tannate contains in 2½ grains the same percentage of pure Quinine as is contained in 1 grain of the Sulphate, and that its effects in equivalent doses are the same as that of the Sulphate. In treatment of diseases of children and persons of delicate taste, it is of the highest value. It is also put up in Chocolate Lozenges, containing each 2½ grs. of Tannate, 2 doz. in a box. Pamphlet sent free on application. Price per box, $1.00. Per ounce, $3.00.

FRANCIS J. GEIS,

Brewer and Maltster, Dobbs' Ferry, N. Y.,

PURE EXTRACT OF MALT.

Sole Agent for the U. S. and Canada, F. ALFRED REICHARDT.

This extract is absolutely pure and superior to **any other** make, foreign or domestic. Made without addition of hops, glucon, and guaranteed to be free from any substance whatsoever foreign to the best barley malt and distilled water. It is also the *cheapest* in the market. Put up in neat 1 lb. jars at 50c. per jar, or $3.75 per gallon, jar inclusive.

F. ALFRED REICHARDT,

Late Helmick, and Helmick & Co.,

Fluid Extract of Damiana.

The most effective preparation made under this name. It is a very efficient uterine tonic of the highest value in Impotency, Prostatitis, Spermatorrhœa, Suppressed Menses, and Catarrh of the Bladder. Its tonic action is as certain as that of Quinine. Put up in bottles of 6 oz. $2.00 per bottle. $16.00 per doz. Pamphlet sent gratis on application.

NITRITE OF AMYL PEARLS.

Made from Dr. E. Squibbe' Nitrite of Amyl. The only ones in the market of correct dosage. 2 and 3 drop, 75c. per doz. 5, 8 and 10 drop, $1.00 per doz.

IODOFORM, CRAYON'S.

Dr. Leblond's formula for Ulcerations of the Cervix. $1.00 per doz.

APIOL CAPSULES,

Absolutely pure. Containing 6 drops. The *only pure* of domestic make. $5.00 per 100.

BRUSH-HOLDING RUBBER STOPPLES.

90c. per doz.

MEDICAL DEPARTMENT OF
HARVARD UNIVERSITY,
BOSTON, MASS.

NINETY-FOURTH ANNUAL ANNOUNCEMENT. (1877-'78.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 27th, 1877, and ends the last Wednesday in June, 1878. Persons who hold no degree in arts or science must hereafter pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 24th.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing

DR. R. H. FITZ, Secretary, 108 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF
YALE COLLEGE.

Spring Term begins March 1, and closes June 26, 1877.

Winter Term begins October 4, 1877; closes January 31, 1878.

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $20.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing

H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar.

SURGICAL

AND

ORTHOPEDICAL

INSTRUMENTS,

Anatomical Preparations,

SKELETONS, &c.

Trusses, Abdominal Supporters, Elastic Stockings, &c., &c.

No instrument is used as often as the Hypodermic Syringe, and consequently they frequently get out of order. To furnish to the profession an instrument which can easily be kept in good working order, and which can be easily repaired, is our object of describing the following:

The instrument has two canulas of steel, either gilt or nickel-plated; will not oxidize; they are tempered, and have an easily-introduced lance-shaped point, which can be easily sharpened. The diameter of the canula is ¾ mm.

The Syringe is contained in a neat Hard Rubber case, the lower part of which holds the Syringe, and a vial of 5 grammes' capacity. The needles are placed in the cover, and are held in position so that they cannot shift and spoil in the case.

The advantages these Syringes possess over others may be briefly summoned as follows:

The construction of the cylinder out of hard rubber or glass, and the simple manner in which the different parts can be attached to another.

The construction of the stopple and the method of filling.

The manner in which the canulas are held in the case.

Dr. GAILLARD T. THOMAS, after examining the above instrument, pronounced the same to be one of the best improvements made in instruments since years.

Dr. G. R. PATTON, Lake City, Minn., writes: The Hypodermic Syringe came while I was away; I am pleased with it beyond expression.

PRICES.

The syringe with glass cylinder	$5 00
The syringe with glass cylinder, in a nickel-plated case, without a vial; very compact	3 50
The syringe with hard rubber cylinder	4 50

WAGNER'S MANUAL

OF

GENERAL PATHOLOGY:

AN

INTRODUCTION TO MEDICINE AND SURGERY FOR STUDENTS.

Translated from the Sixth German Edition,

BY

JOHN VAN DUYN, M.D., OF SYRACUSE. AND E. C. SEGUIN, M.D., OF NEW YORK.

CONTENTS.

GENERAL NOSOLOGY	**Definition of Disease, General Sameiology, Diagnosis, Prognosis, Course, Duration, and Cure of Disease, Death, Apparent Death.**
GENERAL ÆTIOLOGY	**Ordinary External and Internal Causes of Disease, Animal and Vegetable Parasites.**
GENERAL PATHOLOGICAL ANATOMY & PHYSIOLOGY	**Local Disorders of Circulation (Hyperæmia, Embolism, Thrombosis, Etc.). Inflammation, General Alterations of Nutrition, Atrophy, Etc., Necrosis, Etc., Regeneration, Tumors, Etc.**
PATHOLOGY OF THE BLOOD	**Anæmia, Spanæmia, Plethora, Leucocythæmia, Melanæmia, Icterus, Uræmia, Suffocation, Lithæmia, Diabetes, Pyæmia, Fever, Marasmus, Etc.**

NOTICES OF THE PRESS.

"No book in the English language gives such a thorough *resumé* of the elements of Medicine. The work, containing over seven hundred closely printed pages, is a storehouse of carefully-sifted and well-arranged information in all departments of pathology. Unlike many translations, the text is lucid and pleasant reading, and the work is altogether one of the most valuable which has been issued in the English language. It will be invaluable to the student of pathology, and should be in every physician's library."—*Philadelphia Medical Times.*

"It is a book full of knowledge for the practitioner. A medical student could not better commence work than by reading this book through. It has all the modern doctrines and discoveries."—*The Clinic.*

"We consider this book as one of the most valuable of the many medical works translated from the German into English. Its application is general, for it will be found not only upon the shelves of the surgeon and physician, but also in the hands of the medical student, who can rely upon no safer and surer guide through the obscurity which surrounds the causes and phenomena of disease. Above all, it contains what is to be found in no other single volume—it is filled with a complete and comprehensive series of systematically arranged abstracts, which form an epitome of general pathology."—*Boston Medical and Surgical Journal.*

"We commend the book to practitioners and students with perfect confidence that it will not disappoint them."—*Pacific Medical and Surgical Journal.*

. . . . . "Full of interest from the beginning to the end. The profession is certainly indebted to the industrious translators. The reader is likewise under obligations to the publisher for good paper, clear print, and easy handling of the book."—*American Practitioner.*

"The views now held by progressive investigators in this branch of medical science are given in a marvelous mass of well arranged and carefully digested facts, embracing all departments of pathology, and furnishing minute and detailed information on every subject pertaining to the morbid state and disease in all its protean forms. Wagner's systematic arrangement and skill in classification are admirable, particularly elucidating the bearings of facts upon the processes of disease."—*American Journal of Medical Science.*

"The translators have given us a very readable production, and, as a whole, the work is one which makes any library not having it incomplete."—*Peninsular Journal of Medicine.*

TOTAL ABSTINENCE SAVING WINE TILL IT RIPENS.

There is a curious story about some native wines which are extensively advertised nowadays, and have only recently been put upon the market. Dr. Underhill, the well-known grape-grower of Croton Point, died in 1871. Some of his heirs entertained temperance views of such extreme kind, that they were unwilling to allow the stock of wines then on hand to be sold or any more to be made. The grapes have sometimes been sent to market, and sometimes left to decay upon the vines. It is only now that the other heirs have succeeded in arranging for a settlement of the estate and the sale of the wines on hand. Among these is a wine of the vintage of 1864, described as a "Sweet Union Port," but suggesting the Imperial Tokay more than any other European wine, and being wholly unlike any other wine of American growth. Its purity, age and mellowness are remarkable, and both physicians and wine-fanciers have a special interest in it as the oldest native wine now accessible in any considerable quantity. The whole stock is in the hands of the well-known wholesale grocery house of the Thurbers.—*N. Y. Tribune, Nov.* 19, 1877.

The above speaks for itself; but we would add that this is the pure juice of the grape, neither *drugged, liquored* nor *watered;* that it has been ripened and mellowed by age, and for medicinal or sacramental purposes, it is unsurpassed. It can be obtained from most of the leading Druggists throughout the United States, and at wholesale from the undersigned, who will forward descriptive pamphlet, free of charge, on application.

Respectfully, etc.,

H. K. & F. B. THURBER & CO.,

West Broadway, Reade and Hudson Sts.,

NEW YORK.

Sent to Subscribers of The Medical Record for $4.00 a Year.

ANNOUNCEMENT.

An increase of 200 pages additional Reading Matter in a year will be made in

THE AMERICAN JOURNAL OF OBSTETRICS

And Diseases of Women and Children.

PAUL F. MUNDÉ, M.D., Editor.

In consequence of the great increase in the number of subscribers to the AMERICAN JOURNAL OF OBSTETRICS the past year or two, the Publishers take pleasure in announcing that, beginning with January, 1878 (Vol. XI., No. 1.), they will permanently increase each number by *fifty additional pages*, thus giving its subscribers annually about

ONE-THIRD MORE READING MATTER

than heretofore, or, a volume of 896 large octavo pages with *no change in the subscription price.*

An increased number of illustrations, both wood engravings and lithographed plates, may also be expected in future volumes.

While the prosperity of the AMERICAN JOURNAL OF OBSTETRICS, and this consequent substantial evidence of it, cannot fail to be gratifying to all its subscribers and other friends, the Publishers trust the Medical Profession will take this voluntary action on their part as an earnest of their desire and intention, so far as in their power, to make all their publications merit the liberal support which is given them.

Subscription Price, $5.00 per year, invariably in advance.

☞ If any subscriber has a friend to whose notice he would like to commend the Journal, the Publishers will be pleased to mail a Specimen Copy to any address furnished them.

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

PHYSICIANS' RECORD-BOOK.

A short and concise method of keeping accounts of daily practice, by which a great amount of writing is saved.

By using this RECORD-BOOK, each individual's account, providing he receives one or more visits any day in the year, would occupy only

TWELVE LINES IN THE JOURNAL OR RECORD-BOOK,
AND
TWELVE ENTRIES IN THE LEDGER.

Full Size, 500 pages,	**$5.50**
Half Size, 250 pages,	**3.50**
Quarter Size, 125 pages,	**2.50**

All the above are cloth sides and morocco back and corners.

Quarter Size, paper covers,	**$2.00**

Specimen sheets of a new and improved Ledger will be sent on application.

JOHN A. BUTLER, 62 Sudbury Street, Boston.

☞ All kinds of Printing for Physicians done promptly and in good style. *And for sale by* WM. WOOD & CO., New York.

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is generally preferred; or of an **elixir**, when a slight stimulant is desired.

Durel's Syrup of Tar and Iron.

Prepared by DUREL, Pharmacist, Paris.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron, is a desideratum which has at last been attained in this preparation. The indications for such a remedy are many, but it has been found especially useful in ***Chlorosis, Bronchial Catarrh, Catarrh of the Bladder, Chronic Uterine Discharges,*** depending upon an enfeebled or relaxed state of the system.

It is sold by chemists generally.

E. FOUGERA & CO.'S

MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of Ether; Chloroform; Oil of Turpentine; Apiol;
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

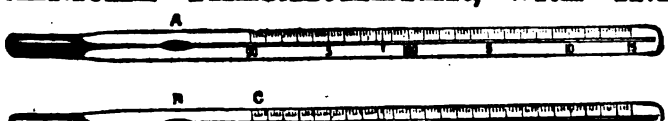
Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Pharmacien, No. 40 Rue Bonaparte, Paris, without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $7 00
We also offer:
No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 5 00
No. 1. Casella's Clinical Thermometer for Hospital use, four or six inch, in neat pocket case..... 3 50
Sent free by mail on receipt of price. Manufactured by L. CASELLA, London.

E. FOUGERA & CO., Agents, 30 North William St. New York.

THE BOSTON

MEDICAL AND SURGICAL JOURNAL

ESTABLISHED 1828.—PUBLISHED WEEKLY.

THE Publishers of THE BOSTON MEDICAL AND SURGICAL JOURNAL wish to call the attention of physicians to certain special features of this journal which make it exceptionally valuable as a medical periodical, and which commend it to the favor of professional gentlemen throughout the United States.

1. It is a weekly publication, thus possessing obvious advantages for the prompt presentation of medical intelligence, a great part of whose value lies in its freshness.

2. Being the only medical publication in New England, it possesses unusual opportunities for obtaining contributions to its pages, and is able to combine the special advantages of both a weekly and a monthly journal.

3. It contains *nothing* but original material. There are no borrowed articles, the current literature of the day being represented, in a manner peculiar to this journal, by a series of reports by experts in special departments of medical science, who give comprehensive and critical summaries of the most recent advances in their respective branches, and who constitute undoubtedly the strongest corps of the kind in the country.

4. It gives special attention to the department of reviews, which are fuller and more carefully prepared than in most medical journals.

5. Reports are received from a large number of medical societies, representing all departments of medicine. The facilities for obtaining clinical contributions from hospital practice have been greatly enlarged, embracing the most important hospitals of New England.

6. The correspondents' department has been organized with great care, and the chief medical centres of the world are here represented. A letter from one of these places appears in each issue of the JOURNAL.

7. A weekly table, showing the comparative mortality rates for the week, of thirteen large cities in the United States.

8. Editorially the JOURNAL aims to represent the profession of the whole country. It is one of the pioneers of medical science in the country, being, with one exception, the oldest now in existence. It was originated and has been maintained by no school or interest whatever beyond that of the science and practice of medicine and the medical profession.

The Editors and Publishers will spare no pains to keep the JOURNAL in the high and honorable position which it has so long occupied among American medical periodicals.

EDITOR.—DR. J. COLLINS WARREN.

EDITORIAL STAFF.—DR. A. D. MASON, DR. C. F. FOLSOM, DR. GEORGE B. SHATTUCK.

EDITORIAL REPORTERS.—DR. G. W. GAY, DR. F. W. GOSS, DR. HAMILTON OSGOOD.

DR. H. P. QUINCY, ANATOMICAL DRAUGHTSMAN.

THE REPORTERS ON MEDICAL PROGRESS in Anatomy, Chemistry, Dentistry, Dermatology, Diseases of Children, Diseases of the Throat and Chest, Electro-Therapeutics, Gynæcology, Materia Medica, Mental Diseases, Military Surgery, Obstetrics, Ophthalmology, Orthopedic Surgery, Otology, Pathology, Physiology, Public Hygiene and Forensic Medicine, Surgery, Syphilis, Theory and Practice of Medicine, and Genito-Urinary Surgery, comprise the principal Professors in the Medical School of Harvard University, and the leading Physicians and Surgeons in the Massachusetts General Hospital, Boston City Hospital, and Boston Lying-in Hospital.

TERMS.—*Five dollars a year*, payable in advance; single numbers *fifteen cents*. *Postage in all cases is paid by the Publishers.* Remittances may be made by draft, money-order, or registered letter to H. O. HOUGHTON & Co., *Riverside Press, Cambridge, Mass.*

PUBLISHED BY

H. O. HOUGHTON AND COMPANY, 1 SOMERSET STREET, BOSTON;
HURD AND HOUGHTON, 13 ASTOR PLACE, NEW YORK.

A Compend of Diagnosis in Pathological Anatomy

With Directions for Making Post Mortem Examinations. By Dr. JOHANNES ORTH. Translated by G. K. SABINE, M.D., and F. C. SHATTUCK, M.D. Revised by R. M. FITZ, M.D. In one volume, 8vo, cloth, $3.50.

In issuing a translation of this recent German work, the publishers have been convinced of its great practical value to all medical students. The directions for making an autopsy are given with great thoroughness and precision; the means of recognizing the various changes which may be found on the different parts of the body are briefly stated in a systematic manner, and the medico-legal bearing of the results of the investigation are always carefully attended to. The description of the gross appearances is also supplemented by thoroughly practical directions in the use of the microscope, when important additional information becomes necessary for exact diagnosis.

Dr. Orth was formerly the assistant of Professor Rindfleisch, and at present holds a like position under Professor Virchow. The teaching which he offers is consequently that of the highest authorities in the very centre of modern investigation in this department of medicine.

The Publishers are the more desirous of calling attention to the translation, as it contains, through the kindness of the author, such additional information and corrections as he has prepared for the second edition of the original work, hereafter to be published. They have received many letters from prominent physicians and surgeons, warmly commending the book, and among them the following:

COLLEGE OF MEDICINE, SYRACUSE UNIVERSITY.
SYRACUSE, N. Y., *December* 5, 1877.

Every physician should carefully read the admirable work of Prof. Orth on "Diagnosis in Pathological Anatomy." For this book teaches —what so few know—how to make a neat *sectio cadaveris*. Prepared by a pupil of Virchow, the greatest pathologist in the world, it is not only fascinating, but authoritative on all points which it discusses. Cleverly translated, the book is one of the best additions to the best recent medical literature. I thank you for the copy sent me. I heartily commend it to my classes, and to my professional brethren here and everywhere.

H. D. DIDAMA.

PHILADELPHIA, *December* 7, 1877.

I have delayed the acknowledgment of the handsome translation of Orth's "Diagnosis in Pathological Anatomy," which you so kindly sent me, until I had time to read it carefully. Its clear and brief, but comprehensive, descriptions of the downright facts of pathology are almost unsurpassed, and although I am at present teaching normal histology, I shall have and use many opportunities of recommending this work to our students.

JOS. G. RICHARDSON.

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMITH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	25 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

See Advertisement of New Formulas in last week's issue, page 5.

McKESSON & ROBBINS' GRANULES, Gelatine-Coated.

Aconitia.....1-60 gr.	**Mercury, Proto-Iodide**....1-5, 1-4, 1-2 gr.
Arsenious Acid....1-50, 1-40, 1-30, 1-20 gr.	**Morphia, Acetate**.....1-8, 1-4 gr.
Atropia.....1-60 gr.	**Morphia, Sulphate** 1-16, 1-10, 1-8, 1-6, 1-4 gr.
Belladonna Extract.....1-4 gr.	**Morphia, Valerianate**..... 1-8 gr.
Calcium, Sulphide.....1-10 gr.	**Podophyllin**.....1-8, 1-4 gr.
Codeia.....1-16, 1-5 gr.	**Quinia**.....1-2, 1-4 gr.
Corrosive Sublimate....1-40, 1-30, 1-20 gr.	**Strychnia**.....1-60, 1-40, 1-30 gr.
Digitalia.....1-60 gr.	**Sulphur, Iodide**.....1-25, 1-10 gr.
This is prepared in our own laboratory and can be confidently relied upon.	**Tartar Emetic**.....1-100, 1-20, 1-4 gr.
Mercury, Bin-Iodide.....1-25, 1-16 gr.	**Zinc, Phosphide**.....1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

Quote MEDICAL RECORD.

SOLUBLE PILLS.

170 WILLIAM STREET, NEW YORK, October, 1876.

THE marked increase during the past few years in the demand for Pills made in accordance with the U. S. Pharmacopœia and other recognized formulas, has induced us to commence their manufacture in our own laboratory, and we are now furnishing Coated Pills, which, for beauty of finish, solubility, and general excellence, are unequaled.

The best substances are used in their manufacture. No article required by a formula is omitted on account of its high cost, nor are any pills deficient in weight; so that we can guarantee them to be made in strict accordance with the standard formulas, *both as regards the materials called for and in weight.*

The pills are coated while soft, and the excipients employed are such as preserve a mass readily soluble in the juices of the stomach, thus insuring prompt action.

The coating, which is soluble and so transparent as to clearly reveal the color of the mass, effectually covers any nauseous taste, and renders the pill easy to be swallowed. Its solubility can be readily tested by allowing a pill to rest upon the tongue for a few seconds.

Particular attention is called to our Granules of Morphine, Strychnine, Arsenious Acid, and other powerful remedies, which are prescribed in minute doses. The desirability of having these medicines in this shape, accurately weighed and ready for administering, has long been recognized. We have taken every precaution to insure accuracy in weight, and can give assurance that in this, as in other particulars, they can be implicitly relied upon.

We shall be happy to furnish any samples that may be desired.

NOTICE—See our Advertisement in alternate numbers of the RECORD.

W. H. Schieffelin & Co., 170 and 172 William St., New York.

ALOIN, { THE ACTIVE PRINCIPLE OF ALOES.

MANUFACTURED BY THE DISCOVERERS,

T. & H. SMITH & CO., Edinburgh and London.

"The uniformity in strength of Aloin, the smallness of its dose, and the certainty of its action should commend it to the favourable consideration of all medical practitioners."—*Vide* DR. WM. CRAIG'S Investigations, published in *Edinburgh Medical Journal* for May, 1875.

Messrs. SMITH will send free by post a Sample of Aloin to any Medical Gentleman desiring it.

Original Communications.

TREATMENT OF DIPHTHERIA.

By W. B. RODMAN, M.D.,

FRANKFORT, KY.

The recent articles of Dr. J. Lewis Smith in the October, 1877, No. *Am. Journal Med. Sciences*, and Dr. Billington in the MEDICAL RECORD, January 12, 1878, prompt me to add my testimony in favor of the treatment advocated by these gentlemen for the cure of diphtheria. For five years I have employed the remedies mentioned in their articles, subject to slight modifications. I was not, nor am I as yet aware that there is anything strikingly new in their plan, as quinine, chlorate of potash, and tincture of the chloride of iron form the basis of numerous treatments for diphtheria, published in the various text-books and medical journals for years past; and I believe there are few practitioners in the country to-day who do not employ one or more of these medicines to combat this disease.

In confining myself to the treatment of diphtheria, I cannot, with propriety, discuss the question whether all cases of idiopathic membranous laryngitis are specific or not. I will relate all cases of this affection which have come under my observation in the last five years, and let my readers draw their own conclusions. Speaking for myself, I regard those cases of membranous laryngitis which have occurred during the prevalence of undoubted diphtheria in the family or immediate neighborhood, as diphtheritic. Those cases which have been isolated and have occurred singly, I consider as "croupous," using this word in its common acceptation.

The first case in which I resorted to this plan of treatment was that of a girl three years old, whom I saw in consultation. Five other children and the father had diphtheritic patches on the fauces. The girl had no alarming symptoms until laryngeal trouble began. It was for this complication I was called. The attending physician had used tincture of iron and quinine, a liberal diet, and stimulants sparingly. I suggested the addition of chlorate of potash to the iron mixture, hot sponges to the throat, and over these oiled silk. I ordered the room to be filled with lime-water vapor, which was accomplished by placing hot rocks in a tub of lime-water, not so elegant a method as the hand-ball or steam atomizer, but certainly as efficacious. In addition to these measures, as occasion required, I used alum, in emetic doses, which cleared the air-passages of mucus and any detached pieces of false membrane which might interfere with the respiration. This treatment was carried out for three days without the slightest variation, notwithstanding the fact that the croupous symptoms were alarming, and no apparent improvement took place. On the morning of the fourth day I was shown a piece of false membrane—an exact cast of the trachea to its bifurcation—which the patient had thrown off the night previous. Notwithstanding the cervical glands were enlarged and the breath fetid, there were no immediate constitutional symptoms indicative of systemic poisoning, but in a short time a decided paralysis supervened, which further confirmed my diagnosis of diphtheria. For this I used no treatment, and the child fully recovered after several weeks had elapsed. The remaining members of the family all recovered, the medicines seeming to limit the extension of the membrane and prevent systemic infection.

The next case was in many respects a most remarkable one. On December 25th, 1874, Col. S. (a citizen of Frankfort), age 40, as robust as any man I ever knew, began to complain of sore throat. For several days he was attended by Surg. J. C. Bailey, U. S. A., who was stationed here at the time. He had several ugly looking patches (diphtheritic?) on his tonsils and palate. These were treated by local applications of nitrate of silver, and some constitutional measures were employed, but I do not recollect what they were. January 2d, 1875, at 4 A.M., Surg. Bailey sent for me to see the case with him. The membranous growth had then invaded the larynx, trachea, and larger bronchial tubes. Lime-water vapor from a steam atomizer was most persistently employed, but still the disease progressed until the smaller bronchial tubes became involved, and our patient died of apnœa at 4 P.M. Col. S. had no enlargement of the cervical glands, no unpleasant odor of breath. There was no case of diphtheria in the county at the time nor for several months thereafter. In other respects his case very much resembled one of diphtheria. In him, the singular phenomenon was observed of the voice being almost hushed from membranous formation in the larynx, and yet the respiration was perfectly free until the disease reached the bronchial tubes. I attribute this circumstance to the large calibre of the larynx and trachea in the adult.

In August, 1875, an endemic of diphtheria prevailed in Frankfort and vicinity. The first case was brought to my office. The boy, aged six years, had a pulse of 100, temp. 100°. Upon examination, a membranous patch was found upon each tonsil. Though I had my fears as to the nature of the trouble, my diagnosis was not confirmed until the day following, when his sister was brought to me similarly affected. I pronounced both to be cases of diphtheria, and at once began my usual constitutional treatment. At that time I used no local applications, relying upon the topical effect of the iron and chlorate of potash mixture as each dose was swallowed. In a few days the patches had entirely disappeared from the boy's throat, the enlargement of the cervical glands and fetor of the breath were gone. He seemed to be well, and I discontinued my treatment and visits. Two days after, I was sent for again. I found the child almost moribund from asthenia. There was no appearance of false membrane anywhere. He died in a few hours, although stimulants and concentrated food were pressed to the utmost. This case taught me a lesson which I now most rigorously observe. At present I never fail to keep up my general remedies for several days after all symptoms of the disease have subsided, preferring to do too much rather than too little. In a series of sixteen cases which came under my own care during this endemic, this was the only one I lost, although three of the series had alarming laryngeal complications. One of these cases I think proper to relate.

My little cousin, Hallie R., age two years, began to complain of sore throat on Sept. 9th. Upon inspection, diphtheritic patches involved both tonsils and palate. I say diphtheritic because the disease was then prevalent in the city, and a sister of Hallie was at the same time attacked with it. I gave her quinine in mucilage of slippery elm, also large and frequently repeated doses of the iron and chlorate of potash mixture. Under this plan she rapidly recovered, and by the 15th I pronounced her well. Profiting, however, by my experience, I continued the remedies until the 20th, and then dismissed her. On the evening of the 28d, she had decided symptoms of croup. I examined her

throat thoroughly and not the slightest trace of membrane was visible. I recommenced the use of the quinine, iron, and potash mixture, applied hot sponges to the throat, and kept the room full of lime-water vapor by hot stones, etc., as in the first case mentioned. I resorted, occasionally, to turpeth mineral as an emetic, regarding the case as one of croup and not diphtheria. I succeeded, in this way, in dislodging enormous quantities of a thick, tenacious mucus, thereby relieving temporarily the labored breathing. The case went on from bad to worse until the night of the 25th, when I thought tracheotomy inevitable. I sent for Asst. Surg. Elbrey, U.S.A., to see the case and assist me in the operation should it become necessary. We concluded to wait a few hours longer, and in that time the child began to improve; a piece of false membrane was expectorated, and from this time she rapidly recovered. At the time I treated this case I was inclined to regard it as one of non-specific membranous laryngitis, and I believe that Dr. Elbrey coincided with me in my opinion; but I think now that the diphtheritic influence was still prevalent, though the child had seemed perfectly well for more than a week.

In the family of Robert Quire, living within a mile of town, I treated four cases of diphtheria. Two of his children, aged four and two years respectively, had diphtheritic laryngitis. By pursuing the same line of treatment as in the preceding case, both recovered. The younger child, however, had paralysis to the extent that it could not stand alone, and did not walk for more than six months unless holding by a chair.

I have never seen a single case of undoubted diphtheritic laryngitis die where this treatment was employed from the beginning; the four cases, occurring in the children above mentioned, comprising all such which have come under my notice. That this treatment may fail me in the future I do not doubt, for it may fall to my lot to meet with cases in which nothing will do good.

Of four cases of supposed croupous laryngitis (cases isolated as to time and place) which I have seen, three died, one recovered. The case of Col. S. has already been noticed. Another, a girl six years of age, was seen by Dr. Sawyer for the first time after an illness of four days. He pronounced her condition an almost hopeless one, decided œdema of the lung being then present. The next day I was called in consultation; tracheotomy was immediately performed—the patient lived twenty-four hours after, and succumbed to the lung complication. A boy, aged two years, had been sick with "croup" for five days. When I first saw him he was almost moribund. Tracheotomy was performed three hours after my first visit. He lived about thirty minutes after the completion of the operation. The successful case was that of a child, aged four months, whom I saw in consultation with Dr. Sawyer. There was undoubted membranous formation in the larynx and trachea. Lime-water vapor (with carbonate of ammonia?) seemed to rescue the little fellow, after a glorious struggle of two days.

What the result might have been in these isolated cases of membranous laryngitis which proved fatal, had the measures advocated in this article been employed in time, no one can tell. The result of treatment speaks for itself in the diphtheritic cases which I have seen, and in those cases related by others adopting a similar course.

The prescription which I generally use for a child five years old, is as follows:

℞. Tinct. ferri chloridi,
Potass. chloratis.....ȝss ʒ ss.
Syrup. limonis,
Aq. destillat.....ȝss ʒ iij.
M. Sig. Teaspoonful every two hours.

℞. Quin. sulph.....ʒj.
Div. in chart. viij.
Sig. One with alternate doses of the mixture.

I direct the nurse to give the quinine in mucilage of slippery elm. I think that children take it more readily in this way than any other. I spray the throat with solutions very much like those recommended by Dr. Smith, but should laryngeal symptoms supervene, I prefer to fill the room with lime-water vapor in the manner before mentioned. Under these circumstances the child can breathe nothing else; there is neither the intermission nor the terror which accompany the use of the atomizer.

The above prescription is singularly like that of Dr. Smith in October, 1877, number of *Am. Jour. Med. Sciences*, and were I not able to produce from the prescription files of my apothecary, for years past, exact copies of the one which I have written, I might fear the charge of plagiarism. One objection to Dr. Smith's prescription is that it contains no water, the menstruum being altogether syrup. Children take the prescription which I offer without trouble.

I will close this report by relating a case recently under my care, which I think fairly illustrates the power of this treatment to control the progress of diphtheria.

January 1, 1878, I was called to see Willie McC., aged six years. He had then been sick three days. Pulse 120, respiration 28, temperature 104°. Cervical glands enlarged, breath fetid. Upon inspection I found an ugly-looking, grayish patch, as large as a silver quarter, completely covering the rigid tonsil. The palate and other tonsil were dry, red, and glazed. The prescriptions above are exact copies of those I ordered for him. In three days the membrane came away; pulse, temperature, and respiration became normal, and appetite good. The throat still presented more of a red and glazed appearance than I liked. I concluded that three times a day was often enough to administer the remedies, and so ordered. Next evening pulse 110, temperature 103°, and a patch of membrane as large as one's finger-nail had formed on the left tonsil. I ordered the doses to be given as frequently as at first, and the throat to be sprayed with carbolic acid and lime-water. The constitutional symptoms at once abated, the membrane never increased in extent, and in a few days I dismissed him well. I will state further, that by isolating this case, and the use of chlorine gas as a disinfectant, I have so far stopped the spread of the disease.

I do not wish to claim too much for this treatment. Thus far, with one exception, the only severe cases of diphtheria which I have had, have been those with laryngeal complications. Some might have been more severe but for the remedies used. I would rely upon this plan in preference to any I know, in all cases of diphtheria, whatever might be their type.

JANUARY, 1878.

THE TREATMENT OF DIPHTHERIA.

BY C. E. WILLARD, M.D.,

PRESIDENT GREENE CO. MED. SOCIETY, CATSKILL, N. Y.

UNDER the head of "Original Communications," in the MEDICAL RECORD for January 12, 1878, is an article on Diphtheria, by C. E. Billington, M.D., and as his treatment is very similar to the course of treatment

I arrived at after many trials, close observation, much worry of mind, and almost constant attendance during three epidemics of diphtheria, I feel constrained to add my mite to what has already been written upon this subject, partly in corroboration of Dr. Billington's article, and partly to induce others to test the treatment pointed out in this paper.

I have recently had in my practice twenty-three cases of diphtheria, with but two deaths.

Of course, all these cases were not equally severe. The recovery in several instances, however, was contrary to all expectation.

I will give in brief the course I have generally pursued. In place of Dr. Billington's iron and glycerine mixture—

℞. Tr. Ferri chloridi..... ʒi. to ʒiss.
Glycerine,
Aquæ.....aa ʒi.
M.

I have, in the majority of my very severe cases, used the following:

℞. Tr. Ferri subsulphatis..... ʒi. to ʒij.
(Monsell's solution)
Aquæ..... ʒij.
M.

thoroughly washing the throat with it, after which I have the patient swallow five drops of the ferri subsulph. diluted in a little glycerine and water, and alternate this with potassæ chlorate, every hour. Once in from four to six hours I give (Squibb's) carbolic acid internally, after first cleansing the throat by gargling with the same, and I make it a special point to always have the throat well rinsed (with the carbolic acid water) previous to taking nourishment.

From four to six times during the day, and once or twice during the night, in extreme cases, I order the vapor of lime to be thoroughly inhaled from ten to twenty minutes, by placing a pail with a little warm water in it near the patient, cover both with a sheet, and drop a lump of lime into the pail, which will begin to boil in a few seconds.

I remove as much of the false membrane as I possibly can, and as often as I can, without injuring the mucous membrane of the throat. To accomplish this, I sometimes take a very thin piece of whalebone, and by scraping it quite sharp along one edge, and doubling it together like a hair-pin, I introduce it below the tonsils, and, much after the manner of reopening a freshly sealed envelope, I gently peel off the false membrane.

I have on several occasions, by this method, averted imminent suffocation. After ridding the throat of what membrane I can in this manner, I at once apply a moderately strong solution of carbolic acid.

I also keep a pail partly filled with the *acid water* near the bed, and order the patient to spit everything into it—in other words, not to swallow *any* of the mucus from the throat. In this manner I have hoped to cut off a part of the poison from being absorbed into the system through the agency of the stomach. The amount expectorated in twenty-four hours is quite astonishing.

I have the house generally disinfected, and as a prophylactic, place the whole household on carbolic acid (Squibb's) ten drops to a goblet of water, letting them use it as a drink. I think I have derived much benefit from this in preventing the spread of the disease.

Of the two cases I lost, one died of paralysis of the heart, and the other from the membrane extending down into the bronchial tubes, causing suffocation.

I have one case on hand at present, and that is doing well.

In nearly all of my cases the membrane has *first* formed on the *left* tonsil or *left* side of the throat. After calling the attention of several other physicians in our town to this fact, they were enabled to corroborate it in their own practice.

Since adopting the above course of treatment my success has been quite uniform, and decidedly in advance of any treatment I had used heretofore.

ON REPORTS OF FATAL AND "SHOCKING" RESULTS OF VACCINATION.

By HENRY AUSTIN MARTIN, M.D.,

BOSTON, MASS.

My attention has just been called to the report of "death following vacination" in your issue of Dec. 22d. Fortunately this case needs no tedious and difficult investigation. A child, three years old, vaccinated in an atmosphere poisoned with the miasma of scarlet fever (which the reporter calls a "cutaneous disease"—a very mild term, surely, for a fever the contagium of which is the most subtle and deadly, in its manifold and protean manifestations, of all its dire family), died from the inoculation with that poison, on the 22d day after vaccination with a quill of bovine virus obtained from a reputable source in St. Louis. A number of other children, vaccinated in the same atmosphere, manifested symptoms precisely the same in character, though not in degree, and did not happen to die; while many other patients, vaccinated in other places with virus taken from the same animal at the same time, exhibited no symptoms except those of a regular and perfect evolution of *vaccinia*.*

Although the reporter seems in great doubt how to class his case, hesitating about erysipelas and syphilis, to neither of which has it the remotest analogy, there does not seem much doubt that it was a case of septicæmia associated with phlebitis and thrombosis, and that the immediate cause of the sudden and unexpected death was the passage of an embolus *directly* (as the vaccination was probably on the left arm) into the heart and instantly arresting its action. If a child were inoculated with pure vaccine lymph, and an hour after with the venom of the viper, and died, would it be fair to even mention vaccination as an element of the case? Yet this is essentially what is done by any one who charges to vaccination the death of a child vaccinated in an atmosphere loaded with volatile contagium of the deadliest character. The reporter speaks of a "mild" epidemic of "scarlatina." The contagium of scarlet fever, is always the same; whether its manifestations in a given subject, or group of subjects, are "mild" or otherwise depends on accidents and influences of which we have either very little knowledge or none at all. The cases reported by Dr. Hawes afford us one item of positive knowledge, viz.: that the inoculation of the contagium of even a "mild" form of that "cutaneous disease" called scarlet fever is far from being a mild or safe operation. No physician would knowingly vaccinate a child in the same house or even neighborhood with a case of hospital gangrene or malignant erysipelas; and if he would not, then even more reluctant should he be to vaccinate in

* This fact, not mentioned by the reporter, was communicated to me at the meeting of the American National Medical Association, in June last, at Chicago, by the gentleman who furnished the virus with which Dr. Hawes' fatal case was vaccinated. Dr. Hawes fails to state an important point, viz., whether the other children who manifested septicæmic symptoms were vaccinated with virus from the same animal.—H. A. M.

an atmosphere impregnated with the even more subtle and lethal poison of diphtheria or scarlet fever. Vaccinate an old adult of broken constitution, and, a week after, let him lie, drunk, with his vaccinated arm buried in a snow-drift for four hours together; let mortification and sloughing of that portion of the skin occupied by the inflamed vaccinal areola take place, and attribute the result to vaccination. Is that fair? But I have known just such a case so reported, and others in all essential respects analogous. These cases *happened* to be after the use of humanized vaccine virus, but I doubt not that they might have happened, under similar circumstances, after that of bovine virus. In 1859, a "doctor" in a country town in Massachusetts was employed to vaccinate the inhabitants. He wished to economize his virus, broke up two and a half scabs, and put the powder into an ounce phial, filled with pure snow-water (he was *so* careful it should be "pure"). From this precious solution the doctor inoculated all comers for ten days without effect, good or bad, vaccinal or other. On the eleventh day, when it was in evidence *at the inquest*, that the bottle, being opened, notwithstanding the purity of the snow-water, such a stench filled the room in a minute, that it was absolutely necessary to open a window, he "*vaccinated*" twenty-five adults. Of these, three, the oldest and least able to bear such inoculation, speedily died; some nine or ten escaped with shattered constitutions and ruined left arms, and would not have been so fortunate as even thus to escape, but for the heroic and efficient treatment of an excellent surgeon, Dr. Gilman Kimball, of Lowell, Mass. Most of the remainder suffered more or less severely. Were these deaths and disasters results of vaccination? Had they anything to do with vaccination? Yet these cases ("The Westford Cases") have been quoted again and again against vaccination and revaccination, and will be so quoted till the end of time. The crusts happened to be of human origin; but I doubt not that an eleven days' solution of bovine vaccine crust, of beefsteak, or canvas-back duck, in *pure* snow-water, would, by inoculation, induce like results. Indeed, I *know* that solutions of beef and mutton, in water of ordinary purity, *did* induce in animals just such symptoms and deaths, after a certain stage of putrescence was reached in the experimental hands of Orfila.*

Thirty-three years of study and daily experience in these matters convinces me that, at the bottom of ninety-nine hundredths of the more terrible stories against vaccination will be found either a gross lie or exaggeration, or some piece of inexcusable malpractice like that just indicated, and that vaccination, properly so called, either with humanized or bovine virus, has really nothing to do with them. The objections to humanized virus are, outside the possible one of being the vehicle of syphilis, principally that its use is liable to the complication of erysipelas, usually of a mild and manageable type, that its use is very apt to be followed by the irritable spurious form of vaccinia, not protective from variola, and that it possibly *always* induces a less permanently protective form of vaccinia than bovine virus, or virus of early removes from the animal. The terrible cases now and then, far too often, appearing in the journals, are the results, like the Westford cases, of (1) the inoculation of animal matter in a certain condition of putrescence; (2) the vaccination of patients in a very morbid condition, who should not be vaccinated at all; (3) the vaccination of elderly or very young persons, and their subsequent exposure to protracted and extreme cold; and (4) the vaccination of patients in a poisonous atmosphere, forgetful of the fact that a volatile atom of contagium is just as inoculable as the particle of contagium contained in the albuminous coating of a charged vaccine-point. The wonderful safety of vaccination, the rarity of serious results, and the insignificance of the fee usually paid for its performance, have all contributed to lead to a forgetfulness that any caution is necessary in performing it to avoid danger, or any inspection of the course and perfection of the result to secure the development of a protective form of vaccinia.

A very large number of vaccinations are made without inquiry as to surrounding influences, morbid or septic, and without the physician ever again seeing his patient. When the profession fully and generally appreciate the possible dangers of vaccination, and that any sort of "sore arm" does not necessarily insure the highest possible protection from small-pox; and when the vast mass of the people also shall feel that vaccination means something more than a very trivial operation, and are willing to pay for the care and repeated visit or visits which should be given to every vaccination, we shall have fewer reports of cases like that of Dr. Hawes, and a much diminished prevalence of variolous disease, following, within even a few months, a performance of the operation which should have prevented it.*

* M. Orfila, "Traité de Toxicologie." Paris, 1843. Tome II., page 630 et seq. "Des Matières Putrifiées."

* In the latter part of 1861, I wrote to that eminent vaccinator, Robert Ceely, of Aylesbury, England, the ablest *original* investigator of cow-pox in the animal since Jenner, for a supply of virus from his famous "stock," obtained by variolation of kine. Not till June 9, 1862, did he answer me, and the following extract from his letter of that date explains the delay, and is very appropriate here:

"The fact is that an epidemic of *scarlatina* having prevailed here for several months past, I have been *obliged* to suspend *all* vaccination till the last fortnight, and as I was desirous of sending you some recent lymph, I have been compelled to defer my reply till now. The lymph which I now send, I have been enabled to revive from tubes which I have kept in store since last December. It is, to my mind, quite satisfactory in its effects, being derived, about six years since, from the inoculation of a cow with the virus of human variola."

This "stock," I may observe, was characterized by an extreme mildness and shortness of duration of the *vaccinia* induced by its use. I propagated it for several years, and have alluded to its peculiarities at great length in my forthcoming report on Animal Vaccination.

A RARE CASE

OF PERIPACHYMENINGITIS SPINALIS, WITH HEMIPLEGIA; COMPLETE RECOVERY.

By L. PUTZEL, M.D.,

NEW YORK.

Wm. T——, æt. 22 years, no hereditary tendency to nervous diseases; patient perfectly healthy until March 8, 1876, when he suddenly felt pain in left shoulder, which soon extended into the other shoulder and into the cervical and upper dorsal regions of the spine; this was attended with strongly-marked torticollis on the left side. The next day, March 9th, patient was admitted to Roosevelt Hospital. For permission to publish his history during his stay in that institution I am indebted to the kindness of Dr. Wm. H. Draper, under whose care the patient was for a part of the time.

On March 13th a swelling was noticed on the back of the neck, on the left side, and a diagnosis of deep abscess in the neck was made. From March 10th to 20th the patient's temperature varied irregularly from 100° to 104°; pulse rapid, and an eruption resembling typhoid appeared on the back and chest;

patient had severe pains in the back and in left extremities. From March 20th to April 1st patient had complete paralysis of the bladder. He now began to suffer from feeling of "tight band" around the lower part of the chest; this lasted eight to ten weeks. Paralysis of motion now began to show itself in the left arm, and soon spread to the left leg; there was also some anæsthesia on the left side of the body. At the end of March paralysis was almost complete on the left side. On April 2d patient began to slowly regain power over the paralyzed parts; the anæsthesia gave way to hyperæsthesia. For a week succeeding this date there was intense pain on the left side; the left leg and arm are now slightly contractured; some pain in right arm. During the whole illness temperature did not go above 105°, and was very irregular.

Patient kept on steadily improving, and was discharged from hospital July 19th. During his sickness patient had fibrillary twitchings in muscles of left side; was costive from the beginning of the attack; never had headache or other cerebral symptoms, except slight strabismus; formication and tingling in left side at times. The patient first came under my own observation about the end of September, 1876, at the Class for Nervous Diseases in the out-door department of Bellevue Hospital. Patient then had partial left hemiplegia; the left arm and forearm were each half an inch smaller than on the right side; the movements of lower limb are much more affected than in the upper limb; patient drags the limb very markedly in walking, and must use a cane; he has a feeling of numbness in the adductors of the thigh and flexors of the leg; sensation otherwise normal; reaction of muscles to electricity is normal for both currents. In the left rhomboid minor muscle is found a small, indurated mass, which is very slightly sensitive to pressure. Patient was treated by local faradization. About the end of December, 1876, the swelling in the rhomboid muscle became tender. and was treated with flying blisters. It persisted until the middle of January, and then disappeared for a few weeks, to reappear again in various places in the right and left rhomboidei and levatores anguli scapulæ. These swellings were somewhat tender on pressure, hard, circumscribed, and immovable. On February 28th patient drew my attention to a small abscess situated over the third and fourth dorsal vertebræ; this was opened, and discharged a small amount of thick pus. On March 1st a very small piece of bone was discharged through the opening, and the next day patient entered Bellevue Hospital, where Dr. Jacobi laid open a sinus extending four inches upwards along the course of the spinous processes; the sinus was probed without any dead bone being found. On the posterior superior angle of the left scapula I obtained a feeling of crepitus, and the patient winced when this spot was pressed upon. The patient left Bellevue after a few days, but was still kept under treatment at the Dispensary by local faradization until July 1st, when he returned to work, approximately cured. On November 20th the patient again reported to me with the sinus completely closed, the swelling and induration in the muscle entirely gone; there is still a slight feeling of roughness over the posterior superior angle of the scapula. The muscular power on the left side is completely restored, the patient now working in an iron foundry without experiencing any difficulty.

Remarks.—The case is evidently one of inflammation within the spinal canal; the exact location of the lesion is a matter of considerable obscurity. In my opinion the diagnosis lies between meningitis spinalis simplex and peripachymeningitis spinalis. My reasons for adopting the latter view are as follows:

1. All of the symptoms of the disease can be readily explained on the theory that it was due to a suppurative inflammation in the cellular tissue between th dura mater and the vertebral bones.

2. Some of the symptoms characteristic of menin gitis were absent.

a. There were no cerebral symptoms whatever; a case of severe spinal meningitis, especially when the cervical portion of the meninges is affected, without the supervention of any cerebral manifestations, is an exceedingly rare clinical experience.

b. No tenderness was observed along the spinous processes, and none of that rigidity of the spine so characteristic of spinal meningitis.

c. There was absence of increased reflex excitability.

3. Paralysis came on later than is usual in cases of meningitis simplex.

4. In cases of meningitis, attended with as much paralysis as was present in this case, there is usually a co-existent myelitis, and recovery is therefore not so complete as in this instance.

5. If we examine the clinical history carefully we will find that the local symptoms were chiefly confined to the left side of the body. The case was, in reality, a spinal hemiplegia, and differs from all others hitherto recorded in the fact that motion and sensation were affected on the same side. The power of voluntary motion was very much diminished on the affected side, while the disorders of sensation, consisting of formication and tingling, hyperæsthesia of the skin, intense pains and then numbness, were also confined almost exclusively to the left side.

These facts prove conclusively, to my mind, that the diseased process must have produced pressure upon the roots of the nerves on the whole left side of the spinal canal, and while it would be highly improbable that a meningitic process should be limited to the whole length of only one lateral half of the cord, it is readily conceivable that this should take place in the peridural connective tissue, where the disease is not so likely to spread as on a serous membrane.

A very interesting question presents itself to our notice when we come to consider the etiology of the affection. Was the inflammatory exudation within the substance of the rhomboid muscle the primary cause of the peripachymeningeal inflammation, or was it secondary to this inflammation?

Although it is impossible to absolutely determine the causal connection existing between these two trains of occurrences, I think that the weight of evidence and probability is strongly in favor of the first assumption.

A review of the bibliography of the subject will throw some light upon the question. After very diligent search I have been able to find records of only seven cases of this disease. Of these one is reported by Mr. John Simon in the "Transactions of the London Pathological Society" for 1855; two cases were reported by Traube before the Berlin Medical Society in 1863; one case detailed by Mannkopf in the *Berlin Medicinische Wochenschrift*, 1864; one formed the basis of a dissertation by Mueller, "Ueber Peripachymeningitis Spinalis," Koenigsberg, 1868; the sixth case is described by Leyden in the "Klinik der Rueckenmarkskrankheiten (no autopsy); and the seventh is also reported by Leyden in the *Berlin Klinische Wochenschrift*, Dec. 17, 1877.

In Mr. Simon's case, the disease followed a fracture of the spine; a large quantity of pus was found from two inches below the foramen magnum along the

whole length of the cord between the dura mater and the inner surface of the vertebræ; the inner surface of the dura mater, the pia mater, and the cord were perfectly normal; two abscesses were found outside of the spinal canal and connecting with it through the intervertebral foramina.

The history of this case, together with the post-mortem appearances, prove that the perimeningeal inflammation was secondary to the abscess formations outside of the canal.

In one of Traube's cases, there were so many minute abscesses in the deep spinal muscles, and the symptoms of their formation appeared so late after the development of meningeal symptoms, that it evidently points to the primary development of the meningeal affection.

Traube's second case is reported so meagrely that it is uncertain whether the peridural tissue was at all implicated, or whether the inner surface of the dura and the pia mater were alone affected; in either event the clinical history renders it very probable that the abscesses found in the spinal muscles were of a secondary nature.

Mannkopf's case is reported very fully and clearly, and it is rendered almost certain by Mannkopf's own arguments, that the disease was secondary to a deep-seated inflammation in the cellular tissue around the larynx and in the deep tracheal muscles. From this situation, the inflammation could be traced along the cellular tissue backwards through the intervertebral foramina into the connective tissue between the dura mater and the 7th cervical and 1st and 2d dorsal vertebræ on the left side posteriorly, forming a tumor there which pressed on the cord; with the exception of slight anæmia, under the site of the tumor, the spinal cord and its membranes presented no abnormal appearances whatever.

Mueller's case, which I have been unable to consult in the original, originated, according to Leyden (in whose clinic the case was reported), in an inflammation around a sarcomatous growth in the subpleural tissue and thence passed through the intervertebral foramina into the perimeningeal connective tissue.

In Leyden's case (no autopsy) the primary symptoms were due to an abscess which was opened in the neighborhood of the left anterior superior spinous process of the ilium and then followed the symptoms of the chronic meningeal affection.

In Leyden's latest reported case, the history is as follows: In March, 1873, patient received a severe blow in the spine and left shoulder. In first few weeks there was pain in left shoulder, with paresis of left arm and some paresis of lower limbs which soon disappeared. His condition remained nearly stationary until January, 1876, when there was an exacerbation of the pains in back and legs and, a week afterwards, paraplegia occurred with paralysis of the sphincters. Towards the end of February, decubitus; in April, 1876, death. Post-mortem revealed a mass about three millimetres thick surrounding the dura mater from the 3d to the 10th dorsal vertebræ; this mass presented the appearances of a chronic inflammatory exudation. The cord was in a condition of acute compression-myelitis. Muscles of left arm showed chronic interstitial myositis; the inflammatory process extended along the loose tissue between the muscles and large nerve-trunks. Leyden thinks it very probable that the whole process originated in the left shoulder and from thence penetrated into the spinal canal.

We find, then, that of the six cases hitherto reported, five were secondary to inflammation outside of the spinal canal and two were apparently primary. The *à priori* evidence is, therefore, in favor of the secondary origin of the affection in our case.

Positive evidence, however, is not wanting to point in the same direction. In the first place, patient states that he noticed the swelling in the neck on the first day of his admission to Roosevelt Hospital, thus showing that the inflammation in the external tissues was at least coincident, in point of time, with the beginning of the spinal affection and, in all probability, antedated it. Secondly, the discharge of a piece of bone from the fistula, together with the fact that I obtained crepitus over the superior posterior angle of the scapula, in the immediate neighborhood of which the swelling first appeared, is quite conclusive to my mind that the morbid process was originally a necrosis of a portion of the scapula, and that the pus, instead of bursting outwards, passed inwards through the intervertebral foramina and there set up a suppurative inflammation around the dura mater.

Reports of Hospitals.

UNIVERSITY OF PENNSYLVANIA, PHILADELPHIA.

CLINIC OF WILLIAM GOODELL, M.D.,

PROFESSOR OF GYNÆCOLOGY.

(Reported for the MEDICAL RECORD.)

CYSTITIS IN THE FEMALE.

VERY few women are free from this trouble at some period or other in their lives. If the womb happens to be retroverted, or anteverted, the consequent pressure upon the neck of the bladder is very likely to bring on inflammation. Again, it may be due to the pressure of a neighboring tumor or one of the internal organs, or be the result of a tedious labor or forceps case. It is very hard to treat cystitis successfully. One method has been to perforate the bladder and remove the irritation, by making a vesico-vaginal fistula. The great difficulty lies in the innate tendency of such artificial fistulæ to heal up at once, so that it needs our constant attention, and perhaps several operations, to keep the fistula open. Knowing how hard it is to cure a natural vesico-vaginal fistula (*i. e.*, one produced during the process of labor, or by some other natural cause), this difficulty in keeping an artificial opening patulous must seem very remarkable to you, and yet such is always the case. The bladder is usually very much thickened by the cystitis, and not only is the operation a very delicate and laborious one, but, as I have said above, a clean-cut incision tends to heal rapidly.

We may attempt to get at the root of the disorder by the introduction into the vagina, each night and morning, of a suppository containing one grain of opium and one grain of belladonna. Or, we may use rectal suppositories containing one grain of the watery extract of opium. Joined with this treatment, which gives very good results in some cases, only the lightest of food should be allowed. Suppose, however, that we are led to believe that the cystitis is largely due to the acrid qualities of the urine. Of course, when this is the case, our efforts must be directed to the neutralization of the urine, and I should

prescribe from ten to fifteen minims of liquor potassii thrice daily in milk. Joined with this, the same amount of the tincture of belladonna may be administered. If both of these modes of treatment fail, we may try to cure by injections into the bladder, say of from four to five ounces of a solution containing from two to three grains of morphia. The bladder absorbs but very slightly, still this injection must not be long retained. A German gynæcologist has lately advised the injection of normal urine into the bladder. The bladder is of course intended for healthy urine, and I have no doubt that this method has great merit, though I have not yet tried it.

Of late years an operation has been devised for the relief of cystitis. If you pass your finger through the junction of the urethra and bladder, you will touch, in the vast majority of cases, a very painful spot. This tenderness may be due either to the presence of a fissure or unhealed ulcer. Physicians in England have cured cystitis by forcibly dilating the urethra. If the cystitis be dependent upon the ulcer, the partial paralysis of the constringing muscles consequent upon the dilatation is the best possible remedy. The woman, after the dilatation has been accomplished, passes her water with far more ease through the yielding sphincter.

I remember one instance where I performed dilatation without any success. It was the case of a woman who had remained all day in a stage-coach without making her water, as a consequence of which imprudence she had a terrible attack of cystitis, joined with retroversion of the womb. As I say, dilatation did no good in that case.

This patient that I bring before you to-day was confined with her second child on the 23d of March, 1877. She is to-day in the third month of a third pregnancy. Ever since the birth of her first child she has suffered from dysuria. Lately she has been obliged to pass her water twenty or thirty times during the day, and from five to ten times during the night. You remember that I dilated this woman's urethra before the class on the 7th of last March. So much good was effected by that dilatation, that she wants me to perform the operation a second time.

Sometimes we give rise to dangerous bleeding during the process of dilatation, but the hemorrhage is usually controllable. If much blood escapes, just pass a threaded needle underneath the part and close up the wound with a stitch.

You see that while I have been talking to you I have introduced a uterine dilator, and have been gradually and gently dilating the sphincter. I usually have a slight laceration; to-day the tear has been the cause of quite considerable bleeding, owing to the highly congested state of the parts. Some doctors use the uterine forceps for dilating, but I prefer this instrument. After inserting it and separating the blades as far as necessary, I allow it to stay in for a short time. You see that it is provided with a little rat-hook which holds it in place. I think that I have now dilated sufficiently to enable me to insert the tip of my little finger. By gently forcing my finger, I am getting it in further and further. I always take this opportunity to investigate the bladder and see that there is no stone in it. There is none here, and moreover, I am not able to discover any serious roughness of the lining membrane of the bladder, except just at the neck. I have passed my little finger all the way in, you see, and will now do the same with my index finger. No harm can happen from this if it be done carefully. I may say in passing that very many physicians insert their little finger into the bladder for the purpose of diagnosticating tumors, etc.

In the vast majority of cases, dilatation is followed by signal success. This woman has only to rise once or twice at night, instead of five or ten times, as formerly. By the way, let me call your attention to the remarkable association existing between the brain and the bladder. When one's bladder is irritated, and not working rightly, the attention is sure to be directed to that organ, and the more we think of it, the more frequently we have to pass water.

I have succeeded in getting the second joint of my index finger through the sphincter, and I think that I have now carried the dilatation far enough. I told you that this woman was in the third month of pregnancy. Some would, no doubt, consider any operation, such as dilatation, dangerous under the circumstances, but I am quite sure that no harm will come of it. I shall order the woman to bed until she is entirely over the effects of the ether. There will be very little pain consequent upon the dilatation.

HÆMATOMA IN DOUGLAS'S POUCH.

This case comes to us as one of tumor of the womb. I am inclined, at first sight, and without questioning the woman, to doubt this statement and rather consider the case one of pelvic cellulitis or pelvic peritonitis. The text-books say that these two are distinct diseases, but I am led to think them, if not one and the same disease, at least very hard to separate. The cellulitis is very likely to, in fact always does, involve the neighboring folds of the peritoneum.

This woman is 42 years old and married. She has had no children, and has suffered from a great deal of dysmenorrhœa at each monthly period. Now, what do these two things suggest? Why, a flexion of the neck of the womb. She tells me that she has been suffering in this way ever since she was seventeen years old. Early in her eighteenth year she went to a doctor for the dysmenorrhœa, and he did something to enlarge her cervical canal, which operation greatly relieved her. She says, by the way, that she menstruates every three weeks.

Just about three weeks ago she had one day a very violent pain across her stomach. Soon after this there was a strong desire to defecate, which could not be satisfied. Since that time she has had constant pain and has always felt a tumor internally.

From what the woman tells me, I am inclined to put my first suspicions entirely out of the question, and say that I believe the patient has had a hemorrhage into Douglas's pouch; that immediately after the hemorrhage the pouch bulged, and so gave rise to the desire to defecate. She was sick a day or two after this pain, and the flow was very abundant. I can feel the tumor on the right side, and can move it slightly. Let me make a rectal and vaginal examination. First, let me pass my finger into her vagina. I feel two tumors, one behind and one before. The tumor in front is not painful. The diagnosis is puzzling. I think the tumor in front is the womb. I can very easily determine this point by passing a sound. Yes, my sound passes in and shows the womb to be of the normal size. But how about the other tumor. What is that? I can move it much more than I could were it cellulitis. Undoubtedly there has been an effusion of blood into Douglas's pouch, which effusion has produced a slight pelvic peritonitis. When blood is effused into, and confined by, a shut cavity, the peritonitis or septicæmia is never so universal as it otherwise would be. By passing my finger into the rectum I am able still more clearly to fix the seat of

the tumor, and at the same time note the fact that the rectum is greatly flattened. It requires some force to pass my finger through the flattened portion; now I have done so, and I find the tumor filling the position of the pouch, hard and immovable. We know that Douglas's pouch is lower on the left than on the right. In exact accordance with this fact I find that the tumor is lower on the left than on the right side.

Pelvic hæmatocele is sometimes exceedingly serious. What is the cause of it? At the time of the monthlies the Graafian follicle may burst before the fimbriated extremity of the Fallopian tube is in relation to receive it, and so blood escapes into the abdomen and gravitates into the pouch. Or there may have been a retention of fluid at the monthlies which was forced from the womb into the Fallopian tube, and so out into Douglas's pouch. Sometimes, you know, extra-uterine fœtation occurs; in fact, there may be hemorrhage into Douglas's pouch from many causes. I believe that hæmatoma in Douglas's pouch occurs frequently without our knowledge.

How are we to treat this pelvic hæmatocele? It may happen, as I have just said, at a monthly period, and is attended with pain and collapse. Of course, we must make a vaginal or rectal examination as soon as we see the case. We find perhaps an obscure fluctuation in Douglas's pouch—the blood is lying loose there, and has not yet, it may be, entirely congealed. The patient must be kept absolutely quiet, and astringent drinks, such as sulphuric acid, lemonade, etc., administered. Opium enough should be given to lull the pain and keep the patient thoroughly quiet. For a number of hours following the attack very slight nourishment should be given. Stimulants should be refrained from, and the patient kept as low as possible, until all immediate danger from peritonitis has passed away. If the woman is married, her vagina should be packed with ice; if a virgin, the ice had better be placed outside.

HABITUAL CONSTIPATION WITH FISSURE OF THE RECTUM.

There is supposed disease of the womb in this case. The woman complains of bearing-down pains and menorrhagia at her monthly periods, and of excessive leucorrhœa between times. No examination has been made thus far, and treatment has only been through the mouth. She has had very obstinate constipation. Costiveness of a very pronounced character is common in women. Men are generally glad to defecate when the desire comes, but women do everything to put off the act, from over-modesty or other causes. This statement holds good not only with reference to the bowels, but also as regards the bladder. You have no idea how often the most violent cystitis is produced by continually restraining the desire to urinate. This patient tells me that her bowels have not been moved freely for *seven years*, and are never moved except by the use of medicines. She says that defecation gives her so much pain that she puts it off as long as possible, and so never takes purgative medicine except once in ten days or so, when she buys an ounce or so of sulphate of magnesia.

I have had the woman put thoroughly under the influence of ether so as to allay spasm and relax all the muscles, and I shall now proceed to make a most careful examination. There is very evidently a post-uterine tumor of some sort or other. I think this will turn out to be a hardened collection of fæces. I shall also probably bring to light one, if not more, fissures of the rectum. Let us see what goes on in the case of obstinate constipation. A species of fermentation ensues, and a large part of the fæces are reabsorbed, giving a yellowish tinge to the complexion and bringing on a chronic torpidity of the liver.

With my finger in the vagina I discover the womb pushed upward and forward, and behind it a hard tumor. I shall now have to make a thorough rectal examination; but, before doing so, it will be well to have my hand and fingers covered with carbolized oil. I am going to use my left hand for this dirty work (I shall probably have to remove the impacted fæces by hand), and I want to enforce upon you all the necessity of working as well with your left hand as your right. Suppose I were called an hour hence to make an examination of a pregnant woman: I might produce the gravest results were I to use the same hand that I am now using, for I could not be absolutely certain that it was free from impurities. However thoroughly I might cover it with carbolized oil, and wash it afterwards with carbolized soap and water, some little taint might still remain, enough to cause septicæmia in a pregnant woman. So all of you should learn to use your left hand when occasion demands, so that the right hand may be kept for cleaner and more delicate work.

Now, what do I discover with regard to this post-uterine tumor? I can indent it slightly by pressure. It is probably a collection of hardened fæces. Two years ago the woman had a child, and if there had been any impaction it would have been forced out then by the descending head. There are three points in the large intestines where obstruction may occur; it rarely, if ever, happens in the small intestines. Those three points are: the caput cæcum in the right iliac fossa, the sigmoid flexure, and the rectum.

Movements of the bowels in some women occur only after very long intervals. Dr. George B. Wood speaks of one case where there had not been a movement for the space of six months.

Where there is such stubborn constipation we generally find, upon examination, a fissure of the rectum. This always renders defecation exceedingly painful. Constipation would give rise to all the symptoms of which this patient complains. Thus, the menorrhagia and leucorrhœa would be caused by the congestion of the womb consequent upon the stasis of the blood in the vessels of the intestines. This might also produce fissures and bleeding piles. The frequent tenesmus may be very easily mistaken for bearing-down pains.

I am going to set to work and break down and remove this collection of hardened fæces. This sometimes requires the handle of a spoon, but I think I can bring them down with my hand in the present instance. But, first let me see if I can discover any fissure of the rectum. To do this I pass one finger into the vagina and evert the lower portion of the rectum. There is a small fissure on the posterior wall. Fissures may be cured in two ways, viz.: 1. By cutting through the adjacent muscular fibres; and 2. By overstretching the sphincter ani. I much prefer the second method. To do this, insert your two thumbs into the rectum and pull them apart until the sphincter begins to yield, or you feel the rami of the ischia on each side. To do this requires the employment of considerable force.

Having stretched the sphincter, I am now better able to remove the fæces. As far as I can reach I feel lumps of hardened fæces. I am able to push them down by the aid of a finger in the vagina. Here is one lump which has entirely lost its fæcal odor and seems to be covered with a sort of false membrane, so long has it been retained. In the present instance I am able to break up these lumps with my hands, but

in some cases I have found them so hard as to require the assistance of a pair of polypus forceps to remove them. I have now removed all the lumps, and am glad to see that the womb has gradually been falling back into place. Evidently, the tumor which she has felt for so long a time was nothing but hardened fæces.

Upon what treatment shall I place this woman? To-night I shall order her ten grains of blue mass, and to-morrow morning two tablespoonfuls of castor-oil. I think that I have removed all the hardened fæces, but if it turns out that the transverse colon is obtructed, she must be given a "gravity injection" filling up the entire lower bowel. Of course, this must not be given while under ether, or we should have no guide as to the quantity of water injected, and thus might inject so much as to burst the bowel.

As regards after-treatment, the patient must be taught to go to stool regularly every day, and to eat certain kinds of food only. For medicine, I shall order the following prescription:

℞. Ext. colocynth. comp..... gr. ij.
Pulv. rhei ..... gr. i.
Ext. belladonna..... gr. ¼.
Ext. hyoscyami..... gr. ss.
M. et in pil. No. 1 divide.
S.—To be taken at bedtime.

In some cases $\frac{1}{60}$ of a grain of strychnia may be added to the above with advantage. Iron must not be employed at present, as it tends to constipate. As regards local treatment, I shall advise the patient to rub her groins and abdomen with a flesh-brush or rough bag of camel's hair. I want here to say a word in strong recommendation of the treatment known as "*massage*." While under this treatment, one of whose items is a daily, painstaking, kneading of the muscles, I have even been able to administer iron without constipating. Indeed, during the second and succeeding weeks of the method by "*massage*," I have noticed a considerable tendency to diarrhœa. I think that the above-mentioned methods of treatment will relieve the woman's torpid liver and congested womb.

Progress of Medical Science.

Sleeplessness and its Treatment.—Dr. Ainslie Hollis, in writing on this subject, maintains that, although the quantity of blood in the brain is diminished during sleep, this diminution is not the sole cause of slumber, for we may have the former without the latter. An increase in the cerebral blood-supply, however, may produce wakefulness, as in the paresis of the cerebral vaso-motor nerves from exhaustion. Sense impressions have the same effect by the continual stimulation of the higher nervous centres. An increase in the velocity of the blood-current through the brain is a frequent cause of wakefulness, as in the irritable and hypertrophied heart. The wakefulness of anæmia is ascribed by Willemin to changes in the nervous elements of the brain, and a consequent modification of the circulation therein.

The treatment of wakefulness he classifies under two heads:

1. The induction of natural sleep.
2. The production of narcosis, or artificial rest.

One of the most efficient means of inducing natural sleep is the application of mustard plasters to the abdomen. According to Schüler, this produces first dilatation, and subsequently contraction of the vessels of the pia mater; changes due to the constriction or dilatation of the peripheral current-areas of the skin. Preyer, of Jena, advocates the administration of a freshly made solution of lactate of soda, or of some milk, or whey, on the hypothesis that sleep may be induced by the introduction of the fatigue products of the body. Where the insomnia depends upon brain exhaustion, Dr. Hollis recommends the administration, just before bed-time, of a tumblerful of hot claret and water, with sugar and nutmeg. The alkalies and alkaline earths are useful when acid dyspepsia is associated with the insomnia. Electricity has been used in the paresis of the vaso-motor nerves due to an overworked brain. In hot weather, sprinkling the floor of the sleeping apartment with water lessens the irritant properties of the air, adding much to the comfort of the sleepers; possibly the quantity of ozone is at the same time increased.

The artificial rest obtained by the use of narcotics seems to be due to a direct interference with the functional activity of the nervous system. Dr. Hollis does not consider the bromides to possess hypnotic properties, although they undoubtedly act as sedatives on the nervous system, and as such may occasionally induce sleep.—*The Practitioner*, Dec., 1877.

Bearings of Chronic Disease of the Heart upon Pregnancy and Parturition.—Dr. Angus Macdonald read a paper on this subject before the Obstetrical Society of Edinburgh, in which he deduced the following conclusions:

1. Chronic heart disease constitutes a grave contra-indication to marriage, more especially if it assumes the form of anything approaching to severe stenosis of the mitral, or to serious aortic incompetency; in such cases, we ought, if consulted, to dissuade from marriage.

2. There is much less danger in the case of mitral insufficiency pure and simple. But still the risk is even then considerable.

3. In all, when consulted, we ought not to give our sanction to marriage, if in chronic heart disease there are any serious symptoms of cardiac disturbance present, such as attacks of dyspnœa, breathlessness, palpitation on exertion, hæmoptysis, etc., and this injunction ought to be the more imperative the younger the patient, and the more recent the acute disorder which has given rise to the chronic lesion.

4. Such patients as are married and have chronic heart disease, ought not to be allowed to suckle their children, as that appears to tend to keep up the cardiac hypertrophy, and increase the risks likely to arise from the defective heart.

5. All possible causes of cold and all severe exertion should be avoided during the pregnancy, if possible, and more particularly during the latter months of it.

6. Premature labor should seldom or never be recommended, because it is so much more likely to do more harm by disturbing the action of the heart and the condition of the lungs, than any good it might produce by terminating the evil effects of the pregnancy. It is to be remembered that relief of symptoms is not certain after delivery, or anything like certain.

7. The only conditions which seem to warrant the induction of premature labor, are the presence of influences which unduly distend the abdomen, and thus keep the diaphragm in a state of continuous elevation.

8. The same careful principles of management

ought to guide us in the case of a patient with chronic heart disease during pregnancy and the lying-in period, as in any other state of the system, similarly complicated with heart disease.

9. In almost all the cases I have met with, chloroform has been given, and apparently with benefit during delivery. If carefully administered, I think it cannot but be useful in all cases.

10. All legitimate means ought to be used to lessen the effects of the down-bearing efforts, and therefore the judicious and timely application of forceps or of turning is extremely important. In cases of a large amount of liquor amnii, timely rupture of the membranes is calculated to be of great service, as it allows the diaphragm to descend, and thus lessens the embarrassment of the lesser circulation.—*The Obstetrical Journal of Great Britain and Ireland*, November, 1877.

Dyspepsia.—In a communication to *The Practitioner* for December, 1877, T. Lauder Brunton, M.D., F.R.S., treats the subject of dyspepsia in an original and interesting manner. For the physiology of the digestive act, and the pathology of the affection in question, he has drawn largely on Dr. Beaumont's reported observations on St. Martin. He treats his subject under two heads, transient and chronic indigestion, including under the first head subacute gastritis, and under the second, chronic gastritis and atonic dyspepsia. Transient indigestion, such as Dr. Beaumont has shown is accompanied by red patches and abrasions of the gastric mucous membrane, may be caused by *a*, an excessive quantity of food; *b*, an improper quality of food; *c*, mechanical chemical qualities of food. The two first causes act mechanically, the third chemically, either through some irritant property of the substance ingested, or through the production of some irritant substance after ingestion, as of butyric acid from the decomposition of fat. This state will pass away under the use, for a short time, of unirritating food in small quantities, but recovery is materially hastened by the administration of a cathartic. Subacute gastritis, Dr. Brunton attributes, among other causes, to the effect of draughts. In the treatment he recommends the use of bismuth and magnesia, combined, if the vomiting is excessive, with hydrocyanic acid and bromide of potassium. If the pain at the epigastrium be severe, a warm poultice, or even a mustard plaster should be applied. In the treatment of chronic gastritis he recommends very highly the use of bicarbonate of soda with some vegetable bitter. When given before meals the alkali stimulates the secretion of gastric juice, while the bitter is supposed to lessen the secretion of mucus. The symptoms of atonic dyspepsia are similar to those of chronic gastric catarrh, with the exception of the epigastric pain and tenderness, and the tongue, instead of being red, or covered with fur through which enlarged papillæ project, is rather pale, flabby, moist, and marked with the teeth at the edges. This condition depends upon weakness of the nervous and circulatory systems. Alkalies and bitters are here also useful, but in addition we must attend to the general condition of the patient, and in these cases strychnia or nux vomica is a most useful adjunct, increasing as it does the excitability of the reflex centres.

Etiology of Goitre.—Dr. Mackenzie considers that the etiology of endemic goitre must be looked for in the geological formation of the territory in which the disease is found. His theory is that the disease depends upon some poison, as yet undetermined, which is absorbed through the agency of the drinking water. In support of this, he quotes Sir Thomas Watson, M'Clelland, Dr. St. Lager, Mr. George Lebour, and others, who all maintain the agency of the water, the two last pointing out sulphate of iron as the offending ingredient, while M'Clelland claims that distinction for the salts of lime and magnesia. Dr. Mackenzie has confined his observations to Great Britain, and, while he does not feel inclined to accept sulphate of iron as the poison for which he is looking, he agrees with Dr. St. Lager in saying that the disease depends upon some of the metalliferous earths. The poison, he continues, has been traced to the soil, the water has been proved to be the vehicle of the poison, and it now only remains to isolate that poison. It may be that goitre is due to some metal or salt with which we are already acquainted, or it may be that spectrum analysis will bring to light some new substance which is the poison so long sought in vain.—*Medical Examiner*, October 25, 1877.

Excision of the Knee-Joint.—Prof. Fenwick, of Montreal, claims that excision of the knee is an operation of greater magnitude than amputation at the lower third of the thigh, statistics showing the mortality to be 27 per cent. in the former, against 22 in the latter. In children the discrepancy is still greater. The removal of the epiphyses and consequent loss of growth in the length of the limb is another drawback to the operation in children. The existence of tubercle of the lung, or of extensive disease of the heart or kidneys, or of any of the important viscera, are contra-indications to excision of the knee-joint. Prof. Fenwick agrees with Mr. Cadge in deeming it useless to excise the knee for disease of the synovial membrane, and quotes Mr. Price, who records twenty-one cases in which the operation was performed for this cause, which were all unsuccessful. Acute suppuration of the joint is, as a rule, unfavorable to excision, although, it is granted, exceptions may occur. From the records of many British surgeons it would appear that in acutely painful articular disease, those cases in which the cartilages and bones are affected are most favorable for excision, and in selecting this operation its advocates recommend its early performance. In military practice the operation is not advocated; the records of our late war show eleven cases, with only two recoveries. Prof. Fenwick then relates the histories of thirteen cases in which the operation was performed for chronic disease of the knee-joint at the Montreal General Hospital. Of these cases nine were cured, one was doubtful, one died, and in two amputation was subsequently performed.—*Transactions of the Canada Medical Association.*

The Detection of Particles of Hepatic Structure in Abscess of the Liver.—Prof. Fenwick urges the examination of the pus from abscesses in the hepatic region as a means both of diagnosis and of prognosis. If the quantity of hepatic substance is large, it may be detected by simply shaking up the pus with distilled water, and examining the precipitate. But if the ulcerative process is going on but slowly, and the hepatic substance is present, in the discharge, in but small quantities, it may be necessary to add a few drops of ammonia to the water, and thus liquefy the pus before the presence of liver-cells may be satisfactorily determined. The abundance of these cells will indicate the activity of the destructive process, and the probability of recovery.—*The Lancet*, November 17, 1877.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, January 26, 1878.

THE MEETING OF THE STATE MEDICAL SOCIETY.

THE meeting of the Medical Society of New York is always an event in which the physicians throughout the State are specially interested, and in which the profession of the country have some concern. As a society it is a model of its kind, and is perhaps more representative in character for the area over which it extends its usefulness than any similar organization elsewhere. The system of government is probably as perfect as can be found in any scientific society, at the same time the details pertaining thereto are not magnified into importance at the expense of strictly scientific work. In fact, far from the latter being the case, the business detail is entrusted to committees, the Society being called upon merely to approve or disapprove the recommendations. So far at least its example is a worthy one for sister societies throughout the country. In regard to the number and character of its scientific communications, it is equal, if not superior to any. But these are acknowledged facts, and are repeated here merely for the sake of introducing some general remarks upon this year's proceedings. As a meeting, the recent one was a success—that is to say, the attendance was good; there were a number of scientific papers presented, and the usual sessions of the Society were well filled with business up to the hour of adjournment. Compared with the previous year, however, the papers were not so numerous nor so well selected, but there was abundance of opportunity for necessary discussion.

It was a matter of regret that the legality of the meeting was not assured before the time appointed for it; not so much on the ground that the proceedings in a medical sense were any the less valuable, but that the correction of a foolish and stupid error was made necessary in open meeting.

We trust, however, that the matter will be fairly settled by the next regular session, and that the time for meeting will be fixed definitely and permanently. There was no other course left for the Society than to call the present meeting an adjourned one, and formally adopt its proceedings at the next regular Session in June. All the trouble could have been avoided by a simple notice of a change a year in advance of the time when it should have been consummated. That this was not thought of last year, when the time of the meeting was changed, is a reflection upon the ordinary astuteness of those members who were conversant with the provisions of the statute, and who either engineered the innovation or tolerated its being made. Let us, however, congratulate the friends of the Society that they have at last touched bottom, and have a promise of a sure foundation for all rulings upon this particular point in the future.

The absence of the President-elect was a misfortune under the circumstances, and helped to foster in the minds of many a distrust in the ultimate success of the meeting. The duties of the office were, however, performed by the Vice-president, who, at the disadvantage of being called on in an emergency, acquitted himself to the satisfaction of all. The absence of the customary presidential address was not generally deplored, and we believe that the time is not far distant when it will be dispensed with altogether, and the time allotted to it devoted to the more strictly scientific business of the Society.

The questions of ethics which came up for adjudication were of some importance. The committee to whom such questions were referred acted wisely and well. In regard to the communication from the County Society, relating to the more explicit interpretation of certain portions of the Code, its action was judicious. It very properly declined to define the law unless some particular case came before it, appealing from a definite decision of a County Society. In other words, the committee did not consider itself competent to prejudge any hypothecated case.

The decision upon the resolution of the Niagara County Society was a literal interpretation of the sentiment of the profession, and will stand on its own merits. We wish we could say as much for the action regarding the erasure of the name of a certain food company from a paper read before the Society. The reason for this course was simply that the food manufactured by said company was patented by them. It does not appear that the article of the Code which refers to the use of patents had anything to do with the particular question at issue. The particular food was recommended by the author of a paper as superior to all others of its kind for alimentation in certain diseases, and the process of its manufacture was described. Although all apparently acknowledged that the article was serviceable, yet because it was patented its name was expunged from the records. Viewed on general principles, this was pandering more to prejudice than to reason.

Every physician believes that it is derogatory to professional dignity "to hold a patent for any surgical instrument or medicine," or "to give certificates attesting the efficacy of patent or secret medicines, or in any way to promote the use of them," but we are at a loss to see the application of these principles to the article under consideration. It is, in the first place, not a medicine, the process of manufacture is not a secret one, and its use is not restricted to the sick. In other words, it is merely an article of general commerce, and its manufacture is protected by a patent for purely commercial reasons. With patent medicines and patent mechanical appliances for the sick the case is so different as scarcely to need comparison.

The selection of the nominating committee, according to the new rule, was a practical success, and the suggestion to alter the statutes in accordance with said rule is eminently proper.

In conclusion, we cannot resist the temptation of congratulating the Society on its choice of president for the ensuing year. Dr. Roosa is a gentleman who has fairly won his present distinction, and cannot fail to perform the duties of his office to the satisfaction of all concerned.

MEDICAL CERTIFICATES IN THE DAILY PAPERS.

THE names of the medical gentlemen of this city, which have been so long attached to the certificates of mineral waters, published in the daily papers, have disappeared at last.

It is but fair to the gentlemen concerned, to state that the majority, if not all of them, soon after the RECORD drew attention to the matter, ordered their names to be withdrawn from the advertisements. The Medical Society of the County added its official recommendation to such a course, and helped, through its Committee of Ethics, to complete the work.

It appeared for a time, however, that the wishes of the writers of the certificates were not to be gratified, and that the mineral water company had determined to publish the certificates in spite of the protests. This, however, was not the case, for as soon as the matter was brought to the knowledge of the proprietors in London, orders were at once issued to remove the certificates from all but strictly medical publications. The company in so doing express a regret that their course heretofore should have been subjected to professional criticism, but state that the publication of medical certificates in the daily papers is common in Great Britain. While we admit the truth of this, we fail to see why this proves that such publications are proper. It is somewhat astonishing that such journals as the *Lancet*, the *British Medical Journal*, and the *Dublin Press and Circular* do not lend their powerful influences to the suppression of this subtle and dangerous form of quackery. The profession there are governed by the self-same code as ourselves, and are bound by the same obligations to each other. It is true, however, that the British Medical Association adopted the Code of Ethics of the American Medical Association only very recently, and it may not have had the opportunity of understanding its purport, or of applying its principles; but the official organ of the British Association, and the *Lancet*, have no excuse for such ignorance.

Now that the names of our own physicians have disappeared, the question arises as to the course which may be pursued by the County Society. This body has the subject under consideration, but in view of the circumstances of the case it will be hardly necessary now to do more than express the sense of the Society in the course pursued by the certificate-writers, which, if properly done, will be a censure in itself, and will prepare the way for the prompt discipline of all future transgressors of the Code. If the County Society gives its opinion explicitly on this point, there need be no trouble concerning the medical certificates in the daily papers in the future.

THE EYE AND EAR RELIEF OF ALBANY, NEW YORK.

WE have been assured that the circulars of the Eye and Ear Relief of Albany, to which reference was made in an article on Albany Ethics in a previous issue, were intended for the medical profession only, and that their circulation has been strictly limited to that body. We state this on the authority of Dr. Robertson himself, which is sufficient to place the statement, as a matter of fact, beyond question. Therefore, that portion of our remarks concerning advertising before the public is not based upon the facts as we understood them at the time of writing the article. We owe this to Dr. Robertson as a simple matter of justice to his motives, and make the correction with pleasure.

Reports of Societies.

MEDICAL SOCIETY OF THE STATE OF NEW YORK.

Seventy-Second Annual Meeting.

HELD IN ALBANY, JANUARY 15, 16, AND 17, 1878.

TUESDAY, JANUARY 15TH.—FIRST DAY.—MORNING SESSION.

THE Society met, pursuant to adjournment, in Albany, at 11 o'clock A.M., and was called to order by the Vice-President, DR. A. L. SAUNDERS, of Madison County.

Prayer was offered by REV. RUFUS W. CLARK, D.D.

VICE-PRESIDENT SAUNDERS alluded to the fact that circumstances had developed which rendered it necessary for him to discharge the duties of President. On the 20th of December he learned from Dr. Jenkins, the President-elect, that he would be unable to attend the present meeting. In the intervening time he had been unable to prepare any address. He would state, however, that the profession continued to advance both in this and other States. It was his earnest hope

that whatever mistakes might have been in the past should be met manfully, and in a manner becoming the medical profession.

COMMITTEE ON CREDENTIALS.

DR. SAUNDERS then announced the Committee on Credentials, as follows: Drs. N. C. Husted, E. H. Lyman, and H. N. Porter.

THE SECRETARY read a communication from Dr. Jenkins, in which he expressed his appreciation of the honor conferred in electing him as the presiding officer of the Society, but declined the acceptance of the office.

DR. PORTER, of Albany, the Treasurer, presented a communication from Dr. Jenkins, transmitting his check for $25 as a donation to the treasury of the Society.

The letter containing the declination of Dr. Jenkins was received, and ordered to be placed on file.

The check was received with thanks, and its accompanying letter ordered to be placed upon record.

ANNOUNCEMENT OF COMMITTEES.

THE VICE-PRESIDENT then announced the following committees:

For *Committee on Arrangements.*—Dr. Wm. H. Bailey, Dr. Wm. Manlius Smith, and Dr. J. N. Northrop.

For *Business Committee.*—Drs. E. R. Squibb, William C. Wey, and D. B. St. John Roosa.

DR. C. H. PORTER offered a series of resolutions to the effect that only delegates and permanent members, who had registered and paid their dues, should be permitted to vote for members of the Nominating Committee in the several Senatorial district caucuses; that each caucus should select a Chairman and a Secretary, and that each Chairman should report the result of the caucus to the Society in writing. The resolutions were adopted.

A recess was then taken to enable the Committee to arrange the order of business.

On reconvening, after a lapse of twenty minutes, DR. BAILEY, Chairman of the Committee on Arrangements, reported the following members by invitation: Drs. G. T. Stevens, Wm. H. Murray, John Thompson, E. Van Slyke, D. H. Cook, and W. L. Purple, Albany; A. E. McDonald, of New York; P. B. Collier, of Valatie; and Wm. D. Lamb, of Lawrence, Mass., Delegate from the Massachusetts State Medical Society.

COMMITTEE ON ETHICS.

THE VICE-PRESIDENT then announced the following Committee on Ethics: Drs. William C. Wey, D. B. St. John Roosa, and James Chapman.

DR. E. R. SQUIBB, Chairman of the Business Committee, then made some remarks as to the legality of the present meeting.

DR. GOULEY moved that the matter be referred to the Business Committee, with power. The motion was carried.

DUDLEY OBSERVATORY.

An invitation was received from the Directors of the Dudley Observatory, requesting the Society to visit that institution. The invitation was accepted with thanks, and between 7½ and 8½ o'clock Wednesday evening fixed upon as the time.

LAW REGULATING FEES FOR EXPERT TESTIMONY.

DR. DIMON, of Cayuga Co., asked the advice of the Society as to the proposition to secure the passage of a law giving proper compensation to medical experts when summoned as witnesses.

The matter was referred to the Business Committee.

DIPLOMA CONFERRED.

The Business Committee announced a communication from the Censors of the Western District, with reference to granting a diploma to ALPHONSE DAGENAIS.

DR. C. M. ALLIN, of New York, moved that a diploma be granted in accordance with the unanimous recommendation of the Censors, and that it be signed by the Vice-President and the Secretary. Carried.

The Society then adjourned, to meet at 3 P.M.

FIRST DAY.—AFTERNOON SESSION.

The Society was called to order at 3 P.M. by the Vice-President.

COMMUNICATIONS FROM COUNTY SOCIETIES.

Under this head, DR. H. G. PIFFARD, of New York, presented a communication from the Medical Society of the County of New York, making inquiry with reference to the meaning of certain sections of the Code.

On motion, made by DR. C. M. ALLIN, of New York, the communication was referred to the Committee on Ethics.

REPORT OF COMMITTEE ON PUBLICATION.

The report of the Committee on Publication was read by DR. E. R. SQUIBB, of Brooklyn. Among the recommendations made by the Committee were the following:

That the amount charged for the Transactions be the publisher's price until the volumes were four or more years old, when, if more than 100 copies remained unsold, they might be disposed of at fifty cents per volume; that when such editions were reduced below 100 copies the price should be raised to one dollar; that each county society should be required to take annually a number of copies equal to five times the number of delegates such county society sends to the State Medical Society; and that the dues of permanent members and delegates should be paid at the beginning of the year.

The report, as signed by Dr. Wyckoff, the Secretary, and Dr. Squibb, and all its recommendations, was adopted.

COMMITTEE ON NOMINATIONS.

For First Senatorial District—Dr. J. W. S. Gouley, of New York County.

For Second Senatorial District—Dr. D. Guernsey, of Dutchess County.

For Third Senatorial District—Dr. M. H. Burton, of Rensselaer County.

For Fourth Senatorial District—Dr. E. D. Ferguson, of Essex County.

For Fifth Senatorial District—Dr. G. W. Cook, of Otsego County.

For Sixth Senatorial District—Dr. J. H. Chittenden, of Broome County.

For Seventh Senatorial District—Dr. Theodore Dimon, of Cayuga County.

For Eighth Senatorial District—Dr. James Chapman, of Orleans County.

Reading of papers being next in order, DR. EUGENE BEACH, of Gloversville, reported a case of

PUNCTURED WOUND OF THE STOMACH, WITH RECOVERY.

The wound was two inches below the point of the sternum and almost exactly in the median line. There

were marked symptoms of collapse, the patient vomited blood and also passed blood by stool.

Two weeks after the occurrence of the accident the patient was up, and at the end of two months appeared entirely well. He had previously been a strong and healthy man.

Dr. A. McLane Hamilton presented a

CONTRIBUTION TO THE STUDY OF AUDITORY EPILEPSY.

An illustrative case was reported. The paper will be published in a subsequent number of the Record.

It was discussed by Dr. Roosa, of New York.

PENILE FISTULÆ IN THE ANTE-SCROTAL REGION.

Dr. Robert F. Weir, of New York, read a brief paper upon the above subject, and illustrated it with colored plates.

The history of a successful operation was reported.

Dr. George Bayles, of New York, presented

A CLINICAL OBSERVATION RELATING TO VACCINATION DURING ATTACKS OF PERTUSSIS.

The conclusion reached was that vaccination exerted a favorable modification upon whooping-cough.

Dr. Cronyn, of Buffalo, remarked that the influence of vaccination upon the course of pertussis had long been recognized, and that he had resorted more or less to it in the treatment of uncomplicated cases during the last thirty years.

REGISTRATION OF VITAL STATISTICS, AND METHODS TO BE ADOPTED TO SECURE DESIRED RESULTS.

Dr. Elisha Harris, of New York, read a paper relating to records of mortality and prevailing diseases. The paper was discussed by Drs. Furbeck, Squibb, and Harris.

Dr. Wm. H. Bailey, Chairman of the Committee on Arrangements, announced the following members by invitation: Drs. Maurice J. Lewi, C. S. Merrill, V. O'Leary, G. H. Newcomb, S. B. Ward, W. G. Tucker, Amos Fowler, J. B. Stonehouse, and Louis Balch, of Albany; Dr. H. H. Beecher, of Norwich, Chenango Co.; Dr. Chas. Hammon, of Schenectady; Drs. A. W. Shiland and R. H. Sabin, of West Troy; Dr. A. J. Long, of Whitehall, and Dr. A. W. Tupper, of Granville, Washington Co.; Dr. C. W. Adams, of Middleville, Herkimer Co.; Dr. E. W. Carmichael, of Sand Lake, Rensselaer Co.; Dr. Chas. E. Willard, of Catskill; Dr. F. S. Greene, of Coxsackie; Dr. Wm. T. White, of New York. The Society then adjourned, to meet at 8 P.M.

First Day.—Evening Session.

The Society was called to order at 8 P.M. by the Vice-President.

REPORT OF THE WORKINGS OF THE INTERNATIONAL CONGRESS HELD AT GENEVA IN 1877.

Dr. E. Seguin, of New York, presented, by invitation, the claims of priority of the American physicians in the movement for the introduction of more uniformity in physic and in pharmacy, and the culmination of this movement in the nomination of an international commission, to whose members all progress of the question must be communicated. Of the the seven commissioners chosen, two are American, two French, one Swiss, another Norwegian; the secretary is Belgian; the president is a professor of surgery of Turino. It was to be hoped that the spirit of this commission would be truly international and progressive, and the American members were determined to give the claim of their compatriots all the prominence it deserves before the International Medical Congress of 1879, which will meet in Amsterdam. The remarks and narrative of Dr. E. Seguin were received with the same earnestness with which he made them.

REPORT ON THE ANTISEPTIC SYSTEM.

Dr. Stephen Smith, of New York, made a report regarding the use of antiseptics in surgery after Lister's plan, and reported several cases.

The paper was discussed by Drs. Weir, of New York, Hutchinson, of Brooklyn, Minor, of New York, Chapman, of Orleans Co., Wolcott, of Utica, Cronyn, of Buffalo, and Squibb, of Brooklyn.

The discussion took the usual routine, and cases were cited in which remarkable recoveries had taken place without the use of the antiseptic system in its details.

RECEPTION AT THE DELAVAN HOUSE.

An invitation was extended to the State Medical Society, by the Albany County Medical Society, to attend a reception at the Delavan House, Wednesday evening, at 9 o'clock.

The invitation was formally accepted by the Society. after which an adjournment was made, to meet on Wednesday, at 10 A.M.

Wednesday, January 16th—Second Day—Morning Session.

The Society was called to order at 10 A.M. by Vice-President Saunders. Prayer was offered by Rev. John McClellan Holmes, D.D. The minutes of the previous day were read and approved.

MEMBERS BY INVITATION.

Dr. Bailey, Chairman of the Committee on Arrangements, announced the following names of members by invitation: Drs. O. D. Ball, E. B. Tefft, Harriet A. Woodward, R. J. Bullock, of Albany; Dr. Maurice Perkins, of Schenectady; and Dr. Meigs Case, of Oneonta.

Dr. J. G. Richardson, of Philadelphia, was introduced as delegate from the Pennsylvania State Medical Society, and made an appropriate response.

THE GOVERNOR'S RECEPTION.

Dr. Bailey also announced that Governor Robinson had expressed a desire to see such of the members of the Society as might be pleased to favor him with a call on this, the regular evening in the week for his receptions.

REPORT OF TREASURER.

Dr. Porter presented his report, which was referred to an auditing committee, composed of Drs. Govan, of Rockland Co., and Burr, of Broome Co.

The report showed that the finances of the Society were not in the most favorable condition, and Dr. Squibb remarked that the sooner the members and delegates became acquainted with the fact the better. Unfortunately, the receipts from the sale of the Transactions did not meet the expense of publication. It was hoped, however, that the provision made with reference to the disposal of books hereafter might replenish the treasury in a satisfactory manner, as far as the publication of the Transactions was concerned.

The Librarian's report was read by the Treasurer.

REPORT OF COMMITTEE ON ETHICS.

Dr. Wey, chairman of the committee, reported upon the communication sent up from the New York County Medical Society, to the effect that Sections 3

and 4 of Article 1, "On the duties for the support of professional character," and also Section 1 of Article 4, "Of the duties of physicians in regard to consultations," were so clear and explicit that they required no special explanation, and therefore the committee was disinclined to offer any comment, inasmuch as there was no evidence of specific violation mentioned; and that county societies were clothed with ample power to require submission, to settle all individual relations with its members, and to inflict salutary censure and penalty. From the action of county societies an appeal might be made to the State Medical Society. The report was unanimous.

On motion made by DR. SQUIBB the report was, without discussion, accepted and adopted.

CODIFICATION OF THE BY-LAWS.

The report of DR. HUTCHINS, of Brooklyn, who was unavoidably absent, was read by Dr. Hutchinson, of Brooklyn. It was accepted and adopted, and will appear in the next volume of Transactions.

CHANGE OF TIME FOR HOLDING THE ANNUAL MEETING—PROGRAMME FOR CORRECTING THE ERROR MADE WITH REFERENCE TO HOLDING THE PRESENT MEETING.

The Business Committee reported that it was desirable to retrace and correct steps made in error relative to the present meeting, and offered resolutions to the effect, (1.) That this meeting, commencing January 15, 1878, is hereby declared to be an adjourned meeting, from June, 1877; (2.) That an annual meeting be held in Albany on the date for holding the next annual meeting—the third Tuesday in June, 1878—when by a quorum, consisting of the presiding officer of this meeting, the Secretary, the Treasurer, and twelve other permanent members or delegates, the transactions of the present meeting shall be ratified.

The report and resolutions were unanimously adopted.

The Business Committee then reported a resolution making provision for changing the time of holding the annual meeting of the Society to the first Tuesday in February. Dr. Goff, of Madison Co., offered an amendment that the annual meeting be held on the third Tuesday of January. Amendment lost. The original motion was then carried by a large majority.

REPORT FAVORING THE PASSAGE OF A LAW RELATING TO EXPERT TESTIMONY.

The Business Committee reported a resolution recommending the passage of a law securing proper compensation for expert testimony.

The resolution was adopted, and on motion made by Dr. Mosher a committee of three, with Dr. Dimon, of Cayuga, as chairman, was appointed to represent the Society in efforts to secure the passage of such a law. The Committee consists of Dr. Dimon, Dr. H. D. Didama, of Syracuse, and Dr. J. V. Kendall, of Baldwinsville.

The Committee on By-Laws made a report, which was referred to Dr. Hutchins, of Brooklyn. The report related to requirements of medical students before commencing the study of medicine.

COMMITTEE ON HYGIENE.

The Business Committee reported that Dr. Stoddard, Chairman of the Committee on Hygiene, was unable to be present, on account of the death of Dr. Dean, of Rochester.

DEATH OF DR. DEAN.

DR. ROOSA presented a resolution, to be sent by telegram to the family of Dr. Dean, expressing the profound sympathy of the profession in their irreparable loss.

The resolution was unanimously adopted.

DEATH OF MEMBERS.

DR. SQUIBB announced the death of Dr. Hiram Corliss and Dr. L. B. Cobb.

SPECIAL ORDER OF BUSINESS.

The resolution introduced at a former meeting by Dr. E. M. Moore, of Rochester, regarding the examination of medical students preparatory to receiving the degree of Doctor in Medicine, was to be the special order for the hour reached; but, owing to the absence of Dr. Moore, on account of the death of Dr. Dean, the committee was continued and the subject passed over until next year.

THE AUDITING COMMITTEE

reported that the Treasurer's account had been found to be correct.

Report adopted and committee discharged.

MISCELLANEOUS BUSINESS.

DRS. H. C. HENDRICK, F. D. BEEBE, and J. C. NELSON were appointed a committee to invite members of the regular profession, who were members of the Legislature, to attend the sessions of the Society.

Reading of papers being next in order, DR. WALTER B. CHASE, of Windham, read upon

LACERATION OF THE CERVIX UTERI AS A FACTOR IN UTERINE DISEASE.

The paper was discussed at length by Drs. Fordyce Barker, A. Jacobi, and H. T. Hanks, of New York.

DISTRICT SCHOOL HYGIENE.

DR. JEWETT, of Canandaigua, read a brief paper upon the above subject, which was referred.

HONORARY MEMBERS.

Communications from Dr. Louis Necker, of Paris, France, and W. A. F. Brown, of Dumfries, Scotland, acknowledging election to honorary membership, were read by the Chairman of the Business Committee.

The Society then adjourned, to meet at 8 P.M.

SECOND DAY.—AFTERNOON SESSION.

The Society was called to order at 8 P.M. by the Vice-President.

The first order of business was the reading of papers.

COMMITTEE ON HYGIENE.

DR. A. N. BELL, of Brooklyn, read a portion of the report of the Committee.

The report on hygiene, from the Medico-Legal Society of New York City, and presented by Dr. C. S. Wood, was called for, but no response was made.

DR. MAURICE PERKINS, of Schenectady, read a brief and valuable paper upon the

ESTIMATION OF UREA.

IMPROVED METHOD OF DETECTING LEUKÆMIA IN ITS EARLY STAGES, AND FOR ENUMERATING WHITE BLOOD-GLOBULES IN DISEASE GENERALLY.

DR. JOSEPH G. RICHARDSON, of Philadelphia, read an interesting paper upon the above subject, which will be published in a future number of the RECORD.

On motion, made by DR. N. C. HUSTED, the thanks of the Society was extended to Dr. Richardson for his

valuable scientific and voluntary contribution to the Transactions.

ISCHÆMIA OF THE RETINA.

Dr. Thos. R. Pooley, of New York, read a paper upon the above subject. It was discussed by Dr. Roosa, of New York.

Dr. Arthur Matthewson, of Brooklyn, read a paper on

DIAGNOSIS OF INTRA-CRANIAL TUMORS, WITH REPORT OF CASES.

MEMBERS BY INVITATION.

Dr. Bailey reported the following names of members by invitation:

Drs. C. E. Nichols and Wm. S. Cooper, of Troy; W. H. T. Reynolds, of Albany; J. L. Archambeault, of Cohoes; Mary Dubois and H. Burdell, of Albany, James D Jones, of Schenectady; James R. Leaming and E. D. Hudson, Jr., of New York; G. L. Ullman, L. C. B. Graveline, P. J. Keegan, S. A. Russell, and Thos. M. Trego, of Albany; and Eli Fox, of Mohawk, Herkimer.

HYDROBROMIC ACID.

Dr. E. R. Squibb, of Brooklyn, read a concise note upon the above subject.

Dr. Goodwillie, of New York, read a paper upon

THE SALIVARY GLANDS—SOME OF THEIR DISEASES AND TREATMENT; ILLUSTRATED BY WAX MODELS.

The history of a case in which a salivary fistula was healed, was reported.

Dr. Benedict, of Syracuse, reported a case of

INTUSSUSCEPTION, WITH SLOUGHING AND EXTRUSION OF A PORTION OF THE SMALL INTESTINE.

The woman recovered, and subsequently died, when it was found that separation occurred about nine inches above the ileo-cæcal valve.

Dr. Giberson, of Brooklyn, presented some

SURGICAL NOTES, WITH A CASE OF NERVE-STRETCHING IN SCIATICA.

The nerve was cut down upon, the finger passed beneath it, and sufficient lifting done to raise the body from the table. Recovery good. The case had resisted all ordinary treatment.

The surgical notes related to operations under the influence of nitrous oxide.

A somewhat lengthy discussion followed regarding the comparative merit of the different anæsthetics. It was participated in by Drs. Matthewson, Goodwillie, Roosa, Squibb, Wey, Wolcott, Benedict, and Giberson.

The Society then adjourned, to meet at 10 o'clock on Thursday morning.

Wednesday Evening.

After visiting Dudley Observatory, the members of the Society and invited guests were handsomely entertained at the Delavan House, by the Medical Society of the County of Albany.

Thursday, January 17th.—Third Day.

The Society was called to order at 10 A.M., by Vice-President Dr. A. L. Saunders, and prayer was offered by Rev. Wm. S. Smart, D.D.

The minutes of the previous day were read and approved.

Dr. Bailey, of the Committee on Arrangements, reported the name of Dr. M. G. Planck, of Schenectady, as member by invitation.

COMMUNICATION FROM NIAGARA COUNTY—ACTION OF THE SOCIETY WITH REFERENCE TO THE CODE OF ETHICS.

Dr. Squibb, from the Business Committee, announced the reception of a communication from Niagara County, which had inadvertently escaped notice at the last meeting of the Society. The communication contained a request that the State Medical Society should take action upon an accompanying resolution, for the purpose of declaring an authoritative decision regarding certain questions connected with the Code of Medical Ethics.

The resolution was as follows:

Resolved, That it is a breach of the Code of Medical Ethics, for a member of a county society which is entitled to send delegates to the State Medical Society, and who is in the *general practice* of his profession, to use upon his sign or bill-heads, or in advertisements, the words "Eye and Ear Infirmary," or "Oculist and Aurist."

Dr. Burr, of Binghamton, moved that the resolution in the communication be adopted as the sense of the Society.

Dr. Chapman, of Orleans, seconded the motion.

Dr. Squibb explained that the passage of the resolution simply affirmed the opinion of the Society, that such terms as those referred to should not be used by a member while in *general practice*.

Dr. Wm. H. Bailey, of Albany, moved to amend by striking out the words "general practice," believing that the use of such words as referred to in the resolution was wrong for the specialist as well as the general practitioner.

Dr. Cook called for the reading of the Code upon the point in question.

Dr. Squibb read sections relating thereto, and expressed the opinion that the words "Eye and Ear Infirmary" implied the *treatment* of *the poor gratis*, and that the words "Oculist and Aurist" referred to the treatment of *special diseases*.

The passage of the resolution was for the purpose of giving general information to the profession in the State, and was not the action of the Society upon a given case.

The amendment offered by Dr. Bailey was unanimously adopted; aff., 45.

The original resolution, as amended, was then unanimously adopted; aff., 46.

CENSOR TO THE UNIVERSITY OF SYRACUSE.

Dr. Wm. H. Bailey, as Censor to the University of Syracuse, presented his report, which was accepted, and ordered upon the minutes.

REPORT OF COMMITTEE ON NOMINATION.

Dr. E. R. Ferguson, Essex, Secretary of the Committee, read the following report:

For President—Dr. D. B. St. John Roosa, of New York.

For Vice-President—Dr. Judson C. Nelson, of Truxton, Cortland Co.

For Secretary—Dr. Wm. Manlius Smith, of Manlius, Onondaga Co.

For Treasurer—Dr. Charles H. Porter, of Albany.

For Censors—Southern District: E. R. Peaslee and E. Eliot, New York, and E. H. Parker, of Poughkeepsie. Eastern District: H. B. Whiton, Troy; J. L. Babcock, Albany; J. P. Sharer, Little Falls. Middle District: M. M. Bagg, Utica; G. W. Cook,

Otego; C. G. Bacon, Fulton. Western District: C. C. Wyckoff, Buffalo; H. Jewett, Canandaigua; C. Green, Homer.

Committee on Correspondence.—First District, T. A. Emmet, New York; Second District, D. Guernsey, Amenia; Third District, R. H. Ward, Troy; Fourth District, T. B. Reynolds, Saratoga; Fifth District, S. G. Wolcott, Utica; Sixth District, J. G. Orton, Binghamton; Seventh District, H. B. Wilbur, Syracuse; Eighth District, C. E. Rider, Rochester.

Committee on Prize Essays.—W. W. Ely and E. M. Moore, Rochester; T. F. Rochester, Buffalo.

Committee on By-Laws.—Wm. C. Wey, Elmira; Wm. Manlius Smith, Manlius; and Wm. H. Bailey, Albany.

Committee on Publication.—H. D. Didama and Alfred Mercer, of Syracuse; Wm. Manlius Smith, Manlius; C. H. Porter, Albany.

Committee on Hygiene.—E. V. Stoddard, Rochester; C. R Agnew, New York; J. G. Orton, Binghamton; M. H. Burton, Troy; D. Guernsey, Amenia; E. Hutchinson, Utica; H. Jewett, Canandaigua.

Permanent Members.—First District: John H. Hinton, J. R. Leaming, and D. B. St. John Roosa, New York, and C. H. Giberson, Brooklyn. Second District: Levi Lounsbery, Stone Ridge, Ulster Co.; P. R. H. Sawyer, Bedford, Westchester Co. Third District: F. B. Parmelee, Greenbush; J. C. Hutchinson, Troy. Fourth District: M. H. Ballou, Mechanicsville, Saratoga Co.; A. J. Long, Whitehall, Washington Co. Fifth District: J. K. Lanning, Fly Creek, Otsego Co.; H. G. Ducois, Camden, Oneida Co. Sixth District: G. W. Avery, Norwich; J. H. Chittenden, Binghamton. Seventh District: J. W. Palmer, Victor, Ontario Co.; W. W. Porter, Syracuse. Eighth District: James Chapman, Medina, Orleans Co.; Wm. Gould, Erie.

Honorary Members.—Clarkson T. Collins, Great Barrington, Mass.

Eligible to Honorary Membership.—L. Auguste Mercier, Paris, France; Christopher Heath and J. C. Bucknill, London, England; H. J. Bowditch, Boston, Mass.; J. S. Billings, U. S. Army.

DELEGATES.

To the Medical Society of the State of Pennsylvania.—G. L. Halsey, Unadilla, Otsego Co.; Wm. C. Wey, Elmira.

To the Massachusetts Medical Society.—H. P. Farnham and J. L. Banks, New York.

To the Connecticut Medical Society.—N. C. Husted, New York; E. M. Lyon, Plattsburg; R. F. Weir, New York.

To the Medical Society of New Jersey.—H. S. Crandall, Leonardsville, Madison Co.; J. C. Nelson, Truxton; Wm. Govan, Stony Point.

To the New Hampshire State Medical Society.—B. F. Smith, Mt. Upton, Chenango Co.

To the Vermont State Medical Society.—C. E. Nichols, Troy; W. H. Ballou, Saratoga Co.; A. J. Long, Washington Co.

To the Rhode Island Medical Society.—A. L. Saunders, Brookfield, Madison Co.; C. M. Allin, New York.

To the Canadian Medical Society.—J. N. Northrip, Albany; E. D. Ferguson, Dannemora, Clinton Co.; E. F. Edgerly, Port Henry, Essex Co.; B. F. Sherman, Ogdensburg.

To the Medical Society of the State of Ohio.—J. R. Pooley, New York; Wm. H. Leonard, East Worcester, Otsego Co.

Censor for the College of Medicine of Syracuse University.—J. S. Bailey, Albany.

Delegates to the American Medical Association.—C. S. Wood, T. Addis Emmett, J. M. Minor, and J. W. S. Gouley, New York; A. N. Bell, Kings; G. J. Fisher and J. Foster Jenkins, Westchester; E. H. Parker, Dutchess; M. H. Burton and R. B. Bontecue, Rensselaer; C. H. Porter, Albany; John P. Gray, Oneida; G. W. Cooke, Otsego; Theodore Dimon, Cayuga; Geo. Burr, Broome; H. Jewett, Ontario; H. C. Hendricks, Cortland; S. G. Wolcott, Oneida; Leroy McLean, Rensselaer; A. J. Long, Washington; J. Mortimer Craw, Jefferson; J. H. Chittenden, Broome; A. Van Der Veer, Albany; T. B. Reynolds, Saratoga; E. M. Moore, Monroe; J. C. Hutchinson and E. R. Squibb, Kings; E. Harris and Stephen Smith, New York; Wm. C. Wey, Chemung; E. R. Hun, Albany; T. F. Rochester, Erie; W. S. Ely, Monroe; A. Flint and F. H. Hamilton, New York; F. Hyde, Cortland; D. B. St. John Roosa, New York.

CERTAIN RECOMMENDATIONS.

The Committee on Nomination also recommended Drs. C. L. Stiles, of Tioga, and W. S. Cooper, of Rensselaer, as eligible to permanent membership.

On motion the report was accepted.

DR. COOK moved that the portion of the report relating to eligibility to permanent membership be laid upon the table.

DR. SQUIBB remarked that the effect of Dr. Cook's motion would be, if it prevailed, to omit the question from the report, and place it in a position from which it could be raised at any future time, if the Society so ordered.

The omission of this portion of the report was regarded as a simple compliance with the by-laws of the Society.

DR. COOK'S motion prevailed by a vote of affirmative thirty to negative nine.

On motion, the report, as amended, was then adopted.

On motion made by DR. COOK, the Vice-President was instructed to cast for the Society an affirmative ballot for the election of all the officers named in the report as amended.

MODIFICATION OF THE STATUTE.

The Business Committee moved that the Secretary and Treasurer be directed to procure such modification of the statute from the legislature as may be necessary to legalize the new mode of selecting permanent members by representation. Carried.

REGISTRATION OF VITAL STATISTICS.

DR. E. HARRIS, of New York, offered a resolution by the passage of which the Society encouraged a thorough registration of vital statistics throughout the State.

Reading of papers being next in order,

DR. L. D. BUCKLEY, of New York, read a valuable paper

ON DIET AND HYGIENE IN DISEASES OF THE SKIN.

Reference was made to the various kinds of food employed in feeding children, and to the different methods of preparation.

A QUESTION OF MEDICAL ETHICS.

In the paper mention was made of food prepared by "The New York Food Company."

DR. SQUIBB suggested that the name of the company should be omitted, inasmuch as the article of food prepared by them was patented. The simple omission of the name of the company was all that was necessary to relieve the Society of a technical

violation of ethics in accepting the paper as it was read.

Dr. Buckley thought the name could do no harm, and that it would aid the physician very much in obtaining a proper article of diet for children.

Dr. Mosher, of Albany, remarked, that if retaining the name would be of positive service in the treatment of disease, it should be considered as an incidental advantage, and be accepted.

Dr. Squibb remarked that the same question was involved as came before the Society two years ago, when in a paper bromo-chloralum was recommended in the treatment of diphtheria. The suggestion which he had made was not aimed at the company at all, but, in his opinion simply the retention of the name in the paper read would be a violation of the medical ethics of the Society.

The Vice-President, Dr. Saunders, opposed the retention of the name of the company, if the paper was to be accepted by the Society.

Dr. Mosher remarked that if our ethics stood in the way of having the best things possible for the cure of disease, it would be wisdom for the Society to so change its Code that we could have the best.

Dr. Squibb remarked that he thoroughly agreed that we should change the Code of Ethics, but that until such change was made we should not change our policy.

Dr. Hutchinson, of Oneida Co., remarked that he endorsed the suggestions in the paper, and should be sorry to see it refused admission to the transactions, but at the same time he did not wish to have the Society endorse either proprietary medicine or food.

Dr. Craig moved that the paper be referred to the Committee on Publications.

Dr. Mosher seconded the motion.

Dr. Squibb remarked that such a motion, if it prevailed, would throw the entire responsibility upon that committee, and thought therefore, it would be better to decide the question in the Society.

Dr. Bulkley signified his willingness to omit the name of the company from his paper, if it was the wish of the Society, and also the name "Nestlé," which had been used.

Dr. J. S. Bailey moved that, "As the sense of the Society, it would be wise to leave the names referred to out of the paper before it appeared in the transactions."

Almost unanimously carried.

The Business Committee *again* called for the paper by Dr. George T. Stevens, of Albany, but received no response.

REPORT ON SCHOOL HYGIENE FROM THE MEDICO-LEGAL SOCIETY OF NEW YORK CITY.

Dr. Squibb, of the Business Committee, remarked that the only remaining paper to be read was a report on School Hygiene, from the Medico-Legal Society of the City of New York.

The report had been presented by Dr. C. S. Wood, of New York, and set down to be heard in connection with other papers and reports upon the same subject. At the time that subject was under consideration, the report was called, but the gentleman who was to read it was not present. It had been called since, but Dr. Wood was not present, and he would therefore now volunteer to read the report himself, inasmuch as Dr. Wood had returned to New York.

Dr. E. Harris moved that the report be accepted, and that the thanks of the Society be extended to the Medico-Legal Society, through Dr. C. S. Wood. Carried.

Dr. Van Derveer, of Albany, presented a paper

ON A SUCCESSFUL CASE OF THE REMOVAL OF A UTERINE FIBROID THROUGH THE POSTERIOR WALLS OF THE VAGINA; AND ELECTROLYSIS IN THE TREATMENT OF UTERINE FIBROIDS BY MEANS OF CUTTER'S NEEDLES.

It was read by title and referred to the Committee on Publication.

Dr. Craig moved that the thanks of the Society be extended to Dr. Saunders for the courteous and dignified manner with which he had presided over its deliberations. Unanimously carried.

Dr. Stiles moved that the thanks of the New York State Medical Society be extended to the Albany County Medical Society for their handsome entertainment at the Delavan House on Wednesday evening. Unanimously carried.

The Secretary reported that 157 permanent members, delegates, and invited guests had been registered.

The minutes were then read and approved.

On motion made by Dr. Squibb, Chairman of the Business Committee, the Society adjourned, to meet on the third Tuesday in June, 1878, which meeting is to be held in the city of Albany, by a *quorum*.

Obituary.

EDMUND RANDOLPH PEASLEE, M.D., LL.D.,

NEW YORK.

Dr. Edmund Randolph Peaslee, the distinguished ovariotomist, died in this city, of pneumonia, Jan. 21st, and within one day of completing his sixty-fourth year. During the past few weeks he had been more than ordinarily driven in his professional labors, and, as a consequence, his general health began to suffer. Just preceding the attack of pneumonia of which he died, he was summoned to the central part of the State to perform an operation. Wishing to economize his time in order to meet other engagements, he rode by rail the whole of one night, performed the operation the following day, and returned the following night, having no rest for thirty-six hours. It would appear that this was beyond his strength, and pneumonia seized upon him at a time when, physically speaking, he was least prepared to meet it. He was ill for about a week, and was not considered in positive danger until within a few hours of his death, when he quietly and suddenly sank.

Dr. Peaslee was born at Newton, N. H., on Jan. 22, 1814. He was educated at Dartmouth College, and was graduated in the same class with Dr. Bartlett, the present President of that university, in the year 1836. He remained at Dartmouth as a tutor until the year 1839, when he entered the medical department of Yale College, from which he was graduated in 1840. During the following year he began the practice of his profession at Hanover, N. H., and also commenced the delivery of a series of lectures on anatomy and physiology at Dartmouth College. He became a professor of those two branches in 1842, and continued to hold that chair until the year 1870. In the year 1843 he was appointed lecturer on anatomy and surgery at Bowdoin College, and was professor of these branches of education during the period from 1845 to 1857, when he gave up anatomy, but continued to act as professor of surgery until 1860. Dr. Peaslee was appointed Professor of Physiology and General Path-

ology, in the year 1851, at the New York Medical College, and from 1858 to 1860 he accepted the Professorship of Obstetrics in the same institution. In the year 1856 the degree of Doctor of Laws was conferred upon him at Dartmouth—his Alma Mater. He was elected Professor of Gynecology at Dartmouth College in 1872, and at Bellevue Hospital Medical College in 1874. He was elected a Trustee of Dartmouth College in the year 1870. He took up his residence in this city in the year 1858, and since that time he has been engaged in the active and responsible duties of his specialty of diseases of women in general, but ovariotomy in particular.

Dr. Peaslee's communications to medical literature were numerous and varied. His tastes were, however, in the direction of surgery, and most of his communications in the different medical journals of the country were upon subjects connected with that department of the healing art. Finally, the circumstances of his practice developed a specialty for him of diseases of females, which, with his surgical tastes, naturally led to the higher walks of ovariotomy. For the latter operation he soon gained a well-deserved reputation, which, after the publication of his book upon the subject, became world-wide, and made him a recognized authority. It is unnecessary to say here what was the effect of the appearance of this work, stamping as it did the individuality of one of the most original workers in that particular line of study. His great success as a specialist was in no small degree due to the liberal and broad culture which prepared him for the place he was to occupy, and in his case particularly, it was the natural outgrowth of an earnest and faithful devotion to general practice. He published many valuable papers in this journal, which lately was his chosen vehicle for communication with the profession. Elaborate and valuable articles were also published from time to time in the *American Journal of Medical Sciences*, *American Medical Monthly*, *New York Medical Journal*, and the *North American Review*.

As a writer he was logical, terse, and convincing, having the rare faculty of bringing out the salient points of his subject in strong relief. As a speaker he was earnest and impressive rather than dogmatic and boisterous, and always carried his audience with him, the natural feebleness of his voice alone operating to his disadvantage.

With the exception of his treatise on Ovariotomy, which must be considered the crowning effort of his life, he published but one other work, that on Human Histology, in 1854. During his residence in this city he was honored with the following positions: President of the Pathological Society, President of the New York County Medical Society, President of the Academy of Medicine, President of the American Gynecological Society, Attending Surgeon of the New York State Woman's Hospital, Consulting Physician to the Strangers' Hospital, Corresponding Fellow of the Obstetrical Society of Berlin, Corresponding Fellow of the Gynecological Society of Boston, and honorary member of the Louisville Obstetrical Society.

As an operator he was bold, yet judicious. Always very careful in his diagnosis, when once his mind was settled regarding the feasibility of an operation, everything else bent to its accomplishment. In regard to the operation of ovariotomy, he was particularly careful of all details, insisting upon certain methods of preparation of the patient and of the operator, which were not observed by others. To these precautions he was inclined to attribute much of his remarkable success in some of the most formidable cases. Notably among the matters of treatment peculiarly his own, was the washing out of the peritoneal cavity in cases of suppurative peritonitis, a method of practice which his earnest advocacy succeeded in establishing.

In general appearance Dr. Peaslee was never robust, but, on the contrary, gave the impression of feeble health, which impression was heightened by his pale cast of countenance, thoughtful and solemn expression, and feeble voice. Still his health was always good, and he was capable of bearing an amount of fatigue from which young and stronger men would shrink.

Dr. Peaslee lived to make an impression upon his day and his generation, the world was made better and wiser for his having lived in it, and he has left behind him a name which shall be cherished by his professional brethren as one of the brightest on record.

Correspondence.

DEATH FOLLOWING VACCINATION.

To the Editor of The Medical Record.

Dear Sir:—The admirably penned report in your issue of December 22d, of a "Death following Vaccination," must have been read by many physicians with closest attention.

This recital of a sad ending, after the most careful use of bovine virus, will revive in many minds the old doubt as to whether bovine lymph does not sometimes beget an undesirable and even a hazardous degree of local action. It will suggest the inquiry whether in case of the abandonment, as now seems probable, of humanized virus, because of its conceded dangers when carelessly selected and used, the universal substitution of bovine stock may not have *its* drawbacks and dangers—dangers, too, that no precautions can wholly avert, as in Dr Hawes' case.

I have before me a circular written in the interest of an animal vaccine establishment, in which it is stated that "vaccination with animal virus certainly does not entail a risk of any greater degree of inflammation than is commonly met with in the use of an active humanized stock. . . ."

Though the observation of one man counts for but little, I have been led to question the correctness of the above statement. I have, in several instances, known severe local action to follow the use of animal virus. In one there was great swelling, extensive sloughing, and weeks of suffering. Had this occurred in a feeble child instead of a strong woman, it might have ended fatally.

I would like to know whether others have observed any difference, and especially whether any one has known a fatal result to follow the careful use of humanized lymph in a healthy child.

Wm. T. Plant, M.D.

Syracuse, N. Y.

Why Milk Sours During Thunder-Storms.—Dr. Malvern Iles, of Baltimore, as the result of numerous experiments, has arrived at the conclusion that the acidity of milk after a thunder-storm is due to the development of lactic and acetic acids, which, in its turn is due to the surrounding oxygen being converted, by electricity, into ozone. The development of the acids, of course, causes the precipitation of the casein.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from January 12 to *January* 19, 1878.

KINSMAN, J. H., Capt. and Asst. Surgeon. Ordered before the Army Medical Board, New York City, for examination for promotion, and, on completion, to return to his proper station. S. O. 9, A. G. O., Jan. 10, 1878.

CALDWELL, D. G., Capt. and Asst. Surgeon. Relieved from duty in Dept. of Texas, to proceed to New York City, and, on arrival, report by letter to the Surgeon-General. S. O. 9, A. G. O., Jan. 10, 1878.

BENTLEY, E., Capt. and Asst. Surgeon. Ordered before the Army Medical Board, New York City, for examination for promotion, and, on completion, to return to his proper station. S. O. 9, C. S., A. G. O.

BARNETT, R., 1st Lieut. and Asst. Surgeon. Assigned to temporary duty at this Headquarters, in the office of the Medical Director. S. O. 8, Dept. of the Gulf, Jan. 14, 1878.

Medical Items and News.

CONTAGIOUS DISEASES — WEEKLY STATEMENT.— Comparative statement of cases of Contagious Diseases reported to the Sanitary Bureau, Health Department, for the two weeks ending January 19, 1878.

Week Ending	Typhus Fever.	Typhoid Fever.	Scarlet Fever.	Cerebro-spinal Meningitis.	Measles.	Diphtheria.	Small-pox.
Jan. 12, 1878....	0	11	91	3	83	80	0
Jan. 19, 1878....	0	10	82	3	78	88	0

SPENCER WELLS.—Mr. Spencer Wells, the ovariotomist, has resigned his position as Surgeon to the Samaritan Hospital, London, and has been elected Consulting Surgeon. He is said to have performed ovariotomy in this hospital and private practice over nine hundred times. In four hundred and four hospital cases the deaths were ninety-nine.

MEDICAL MATTERS IN NEW YORK, BY AN OUTSIDER.—An amusing and piquant letter concerning medical matters in New York appears in the issue of *The Clinic* (Cincinnati, Ohio) of Jan. 12th. We commend its reading to such celebrities here as may be anxious to know how they impress casual visitors.

ALLEGED DEATHS FROM VACCINATION AT SHEFFIELD.—Inquests have recently been held at Sheffield on three children who have died soon after vaccination. From the medical evidence, it appears that death was caused in all three by erysipelas and bronchitis. The children were vaccinated by an unqualified assistant named Turner, in the employment of a Mr. O'Meara, who appears to be proprietor of a number of dispensaries in Sheffield, and in charge of one of these he had placed Turner. The jury returned a verdict against Turner in two of the cases, and he is committed for trial at the Assizes on a charge of manslaughter. The coroner passed some severe, though just, strictures on the loose way in which Mr. O'Meara conducted the practice of this dispensary, which he had practically entrusted to an unqualified assistant. As the evidence will be more fully and completely given at the Assizes, we shall reserve further comment till then.—*British Med. Jour.*

PREVENTION OF CATARRH.—A writer in an English contemporary states that he has been successful in warding off attacks of catarrh by the daily use of a grain of quinine.

MIXED PRESCRIPTIONS AND AMATEUR PRESCRIBING.—Mark Twain, in a recent number of *Belgravia*, declares that a certain skipper in the North Pacific has lost his faith in medical combinations: "There is something rotten about this medicine-chest business. One of my men was sick—nothing much the matter. I looked into the book; it said, 'Give him a teaspoonful of No. 15.' I went to the medicine-chest, and I see I was out of No. 15. I judged I'd get up a combination somehow that would fill the bill; so I hove into the fellow half a teaspoonful of No. 8 and half a teaspoonful of No. 7, and I'll be hanged if it didn't kill him in fifteen minutes. There's something wrong about this medicine-chest system that's too many for me!"

THE DOGMA OF HUMAN RESPONSIBILITY, more especially as it relates to inebriety, was ably considered by the Rev. J. Willett in a paper read before the Annual Meeting of the American Association for the Cure of Inebriates. Although he considers drunkenness a disease, he claims it to be both a voidable and a curable one; voidable by a proper exercise of that self-control which every individual should possess, but curable only by the use of a certain amount of restraint, for which residence in a hospital is necessary. The influence of an inherited appetite, Mr. Willett thinks, can scarcely be overestimated, and, as a proof of the evil effects of the disease, he quotes Dr. Dugas, of the Georgia Medical College, who says: "I do not hesitate to proclaim it as a law of almost universal application that three successive generations of drunkards will leave no issue. The third generation may have children, but not one of these will be reared."

A CASE OF ARSENICAL POISONING TREATED WITH DIALYZED IRON.—The following case is reported by Dr. T. B. Reed: Miss S. accidentally left in the pocket of her gown a paper of arsenious acid, which had been procured to kill rats. Some days after, she filled the same pocket with gumdrops and bonbons, and sat down to her work. She noticed an unusual quantity of white powder on her candy, but carelessly brushed it off without further thought. Probably an hour and a half passed in this way, when she suddenly became deathly sick, and was, at the same, time seized with an intense pain, feeling as if "she had had a pure mustard-plaster on the inside of her stomach." She now remembered the arsenic, and immediately endeavored to relieve her stomach with warm water. Failing in this, she hastened to the Doctor's office, who administered half a tablespoonful of dialyzed iron (Wyeth's) from a sample bottle on his table. This gave almost instantaneous relief, and the dose was repeated in ten minutes, then every half hour, and later, every hour during the day. There was no return of pain except some slight cramps in the lower bowel and limbs, and a dose of magnesia, mucilaginous drink, soft food, and an occasional dose of the iron completed the cure in a few days. In the pocket were found two gumdrops and one bonbon, all thickly covered with a white powder. This was carefully removed with a brush, and found to weigh $3\frac{1}{2}$ grains. The gum and sugar was then removed, and the remainder weighed $2\frac{1}{15}$ grains. This shows that a considerable amount of the poison must have been taken.—*Philadelphia Medical Times*, December 8, 1877.

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachm.
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its present sale exceeds $100,000 per year at wholesale. Its almost universal adoption by the profession, as the above figures show, is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK'S preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proven itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

NEW YORK, *April 6th*, 1875.

W. H. Schieffelin & Co.'s

SOLUBLE QUININE PILLS.

We would be glad to have *any* of our Soluble Pills subjected to intelligent test; but as the medicine most in demand in pilular form is Quinine, we particularly court a critical examination of our Quinine Pills, and desire that they be subjected to the test either of analysis or of therapeutic effect.

This scrutiny is invited with confidence, as we invariably use *bleached* Sulphate of Quinine, of the best American brands, in full and exact weights, and because we have never heard of a case where our pills failed to produce the effect which would have been obtained from an equal quantity of Sulphate of Quinine in its usual form.

In order to facilitate an analysis, we suggest the following process as simple and reliable.

Remove the coating from pills representing say 20 grains of Quinine. Separate excipient by rubbing them in a mortar with 2 ozs. water until perfectly smooth, and then dissolving by aid of a few drops of dilute Sulphuric Acid and filtering. Treat the filtrate with aqua ammoniæ in excess and filter again. Wash the precipitate left on the filter, by passing 1 oz. water through it. Dry on filter by gentle heat. Subject 10 grains of it to the

TEST FOR QUININE,

Published in the *U. S. Pharmacopœia*, as follows:

"When ten grains of the salt are agitated in a test-tube with ten minims of officinal water of Ammonia and sixty grains of Ether, and allowed to rest, the resulting liquid separates into two transparent and colorless layers, without any white or crystalline matter at the surface of contact."

Any such matter floating there would indicate the presence of Cinchonia, Cinchonidia, or Quinidia.

We are happy to announce that the recent decline in the price of Quinine enabled us to reduce the price of the pills; as may be seen by referring to our latest Price-Lists.

CAUTION!!—SPECIFY McKESSON & ROBBINS'.

The Spheroidal or Capsule shape of McKesson & Robbins' Pills is the best adapted to the throat, and obviates the sickening sensation so universal in swallowing a round Pill.

McKESSON & ROBBINS'

PILLS AND GRANULES,

OF THE

U. S. PHARMACOPIA & OTHER RELIABLE FORMULÆ,

GELATINE-COATED,

Process and Machinery Patented,

91 & 93 Fulton, 80, 82 & 84 Ann Sts., N. Y.

NEW THERAPEUTICAL NOTES.

CHARCOAL, WILLOW, ... 5 grs.

The value of pure powdered Willow Charcoal in Dyspepsia, Indigestion and all affections arising from derangements of the stomach, such as Headache, Heartburn, &c., is well known. Its value must necessarily be much increased, since it is, for the first time, presented in a convenient, reliable and unobjectionable form, in our Gelatine-Coated Pills.

IRON, DIALYSED, ... 2 grs.

Made from Merck's scales or plates of Dialysed Iron, and, about 20 times the strength of the Solutions in market.

SALICIN, ... 2½ and 5 grs.

Salicin is becoming more and more favorably known in the treatment of Rheumatic affections, also as a Tonic, Astringent, and Anti-Periodic, and is best exhibited in our Gelatine-Coated Pills. In Acute Rheumatism, Salicin has been found very efficacious, and according to "The Lancet," not less certain, than Quinine is for the Ague. In large doses, it has been claimed to be an absolute specific in Cornëitis (suppurative). Price, reduced.

MONOBROMATED CAMPHOR, ... 2 and 3 grs.

Is now being considerably used in treatment of Spermatorrhœa; strongly recommended in cases of Cerebral-Anæmia; used successfully in Infantile Convulsions from teething; Hysteria; Headache from over study or nervousness, and Nymphomania. (Dose, 3 to 4 grs.)

CALCIUM, SULPHIDE, ... 1-10 gr.

Strongly recommended "in cases of Scrofulous and other unhealthy sores, Glandular Enlargement, Boils occuring in crops, &c." In many skin diseases, it is strongly indicated, being not only Anti-parasitic and Anti-herpetic, but also stimulant and tonic.

An eminent physician, who has given much attention to the use of Sulphide of Calcium and cites several very interesting cases of cures of Abscesses, through its medium. In his words: "The Sulphide of Calcium is indicated in Scrofulous and unhealthy sores and Glandular Enlargements, in Boils appearing in crops, and in carbuncles—in any diathesis with a tendency to Abscesses with suppuration."

CERIUM, OXALATE, ... 1 gr.

Used as a remedy in the sick stomach of pregnant women, and in the vomiting of pregnancy, as well as in Phthisis, Hysteria, Pyrosis and Atonic Dyspepsia. (Dose, 1 to 3.)

PHOSPHORUS, ... 1-100, 1-50, 1-30, 1-20, 1-12 gr.

The pure transparent Gelatine we use is in no degree porous, it preserves the Phosphorus perfectly in the free state; while sugar, owing to its crystaline nature, is very porous, and will admit of rapid change in substances, of a delicate character, covered with it. We have the Phosphorus in state of solution in the excipient we employ, this insures a gradual elimination of the Phosphorus in the stomach, thus avoiding the severe irritation that is so often experienced after taking the ordinary Phosphorus Pills, which are prepared by mixing the Phosphorus in substance with the excipient, in which small fragments of Phosphorus often remain. Note remarks by Dr. Squibb, in his paper before Am. Pharm. Ass'n, Sept., '76, in which he states that Phosphorus should never be administered in substance, and if a coating be used, he commends Gelatine.

Many of the most eminent physicians throughout the country, among whom are leading specialists in the treatment of Neurotic diseases, assert that McKesson & Robbins' Phosphorus Pills are the most rational medium yet found for exhibiting Phosphorus.

PHOSPHORUS COMPOUND, McKesson & Robbins' Pills, 1/60, 1/30 & 1/100 gr.

PHOSPHORUS COMPOUND AND IRON, McKesson & Robbins' Pills.

Every drug and chemical used in McKesson & Robbins' Pills are thoroughly tested by a competent chemist, and the Pills repeatedly analyzed to prove correctness in the synthesis.

CAUTION!!—SPECIFY McKESSON & ROBBINS'.

In corresponding with Advertisers please mention **The Medical Record.**

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist.

PHOSPHORUS PILLS—PRICE REDUCED.

Believing that the present demand for Sugar-Coated Pills of Phosphorus and its combinations will justify a reduction of the price, Messrs. Allaire Woodward & Co. have modified their list on these pills, as follows:

Phosphorus, 1-100 gr. per 100 - - - 40c.	Phos., Iron & Quinine, Phosphorus, 1-100 gr. / Vallet's Mass, 1 " / Quinia Sul., 1 " ———
" 1-50 " " - - 40c.	
" 1-25 " " - - - 40c.	Phos., Iron, Nux & Quin., Phosphorus, 1-100 " / Vallet's Mass. 1 " / Ext. Nux. Vom. ½ " / Quinine, Sul., 1 " ———
Phosphorus Comp'd, Phosphorus, 1-100 gr. / Ext. Nux. Vom., ½ " 50c.	Phosphide Zinc, 1-2 gr. per 100 - - $1 25
" and Nux. Vom. Phosphorus, 1-50 " / Ext. Nux. Vom., ½ " 50c.	" 1-4 " " - - 80
" Iron & Nx. Vm. Phosphorus, 1-100 " / Vallet's Mass 1 " / Ext. Nux. Vom. ½ " 60c.	" 1-8 " " - - 60
	" and Nux, each 1-8 gr. - 60
	" Nux & Ext. Can'bis Ind. ea. 1-8 gr. 65

The manufacturers feel confident that by their mode of manipulating the mass, *less of the objectionable effects* will be experienced by the patient, and *better results* obtained than by the use of any similar goods in the market. *Pills will be mailed to any part of the world upon receipt of list price.* Complete lists of Sugar-Coated Pills. Fluid and Solid Extracts mailed upon application.

ALLAIRE WOODWARD & CO., Peoria, Ill.

The attention of the medical profession is invited to this instrument as the most perfect ever invented for treating Prolapsus Uteri, or falling of the Womb. It is an Abdominal and Uterine Supporter combined.

The Abdominal Support is a broad morocco leather belt with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen.

The Uterine Support is a cup and stem made of very highly polished hard rubber, very light and durable, shaped

to fit the mouth of the womb with openings for the secretions to pass out, and which can be sent to any curve desired, by heating in very hot water.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, pass down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic, adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversion, or any Flexion of the Womb, and is used by the leading Physicians with never-failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price, with 16 cents added for postage; or by express C. O. D.

Dr. McINTOSH'S NATURAL UTERINE SUPPORTER CO., 296 West Lake Street, Chicago, Ill.

Our valuable pamphlet, "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

In corresponding with Advertisers please mention **The Medical Record.**

Pneumatic Aspiration

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

"I have thrust these needles into almost every part of the body; into the Joints, the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:

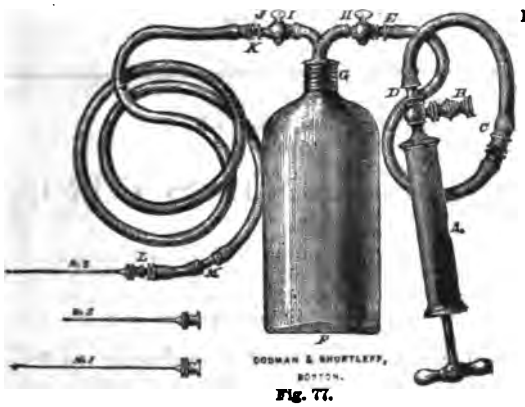

Fig. 68.

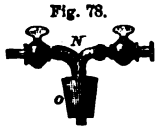
Fig. 77.

Fig. 78.



The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce healthy action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration.

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hæmatic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold-plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions.....$18 00

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78), to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions, 16 00

No. 3. Dieulafoy's Notched Aspirator, Nickel-plated, with two Needles, Tubes, etc., in case..... $14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional, ... 6 00

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post-paid, by mail, on receipt of..... ..... 3 40

☞ *Full description on application.*

An Illustrated Catalogue of Surgical Instruments, also a New Pamphlet on Atomization of Liquids, with description of Improved Apparatus and Formula of Remedies successfully employed, will be forwarded, post-paid, on application.

BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

DOCTOR CLIN'S

(Laureate of the Faculty of Medicine of Paris. Prix Monthyon.)

CAPSULES AND DRAGEES

Of Bromide of Camphor.

"These remedies are prescribed when it is necessary to produce an energetic sedation on the circulatory system, and particularly on the nervous cerebro-spinal system.

"They constitute one of the most energetic *anti-spasmodic* and *hypnotic* medicines."—*Gazette des Hopitaux.*

"*Dr. Clin's Capsules and Dragees of Bromide of Camphor* are those employed in all the experiments made in the hospitals of Paris."—*Union Medicale.*

Dr. Clin's Capsules contain 4 grains, and the Dragees 2 grains, of genuine Bromide of Camphor.

N.B.—*Dr. Clin's Gluten Capsules* are very rapidly dissolved in the stomach, and should be preferably employed for a long treatment, and when the administering of Bromide of Camphor at a great dose would be considered as beneficial.

Prepared by CLIN & CO., Pharmacists, Paris.

DUCRO'S ALIMENTARY ELIXIR,

A Combination Uniting the Properties of Alcoholic Stimulants and Raw Meat.

This preparation, which has been used with great success in the hospitals of Paris since 1868, is adapted to the treatment of all diseases requiring the administration, in a small volume, of a tonic able to stimulate and support the vital forces, as *Pulmonary Phthisis, Depression* and *Nervous Debility, Adynamia, Malarious Cachexia,* etc.

Prepared by DUCRO & CIE, Paris.

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

In corresponding with Advertisers please mention **The Medical Record.**

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of 1-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

A ... the proportion of one grain to the dose. This combination is intended to meet those cases w ... the physician desires to add a more energetic alterative and restorative to the treatment w ... Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from p ... physicians referring to it in terms of high praise.

MANUFACTURED BY

TROMMER EXTRACT OF MALT CO.,

FREMONT, OHIO.

In corresponding with Advertisers please mention **The Medical Record.**

Peck's Cod-Liver Oil and Wild-Cherry Bark.

Unequalled for rapid and efficient action in Phthisis, Deficient Nutrition, etc. Agrees with the most delicate stomach, never causes eructations, is a positive tonic. Its taste is far more agreeable than that of any other combination. It is a perfect emulsion of fifty per cent. of oil and twenty-five per cent. of bark, from which the oil does not separate, and which keeps indefinitely without change.

Dr. W. L. ATLEE, Jr., Philadelphia, writes:—"I have used your Ol. Morrh. cum Prun. Virg. in upwards of a hundred cases. The results were invariably satisfactory and very much better than I ever obtained with other preparations of Cod-Liver Oil."

Peck's Elixir of Phosphorus.

For Paralysis, Melancholia, Lapse of Memory, etc. A powerful Aphrodisiac. A clear, permanent, palatable solution, containing $\frac{1}{100}$ gr. unaltered Phosphorus in each teaspoonful.

Sold by apothecaries generally.

H. T. PECK & CO., Chemists, Philadelphia.

EASTERN DISPENSARY—VACCINE DEPARTMENT.

PURE BOVINE (ANIMAL) VIRUS.

This Virus is the result of a continued reproduction from the famed Beaugency stock, propagated under our own immediate supervision at Pearl River, N. Y. It is furnished at the following reasonable

SCALE OF PRICES:

One Quill Slip,	**$ .25**	**Fluid in Capillary Tube,**	**$1.00**
Seven Slips,	**1.00**	**Three Tubes,**	**2.00**

N.B.—Each tube will vaccinate from five to ten persons.

Concrete Vesicle—i. e., Crust or Scab, $1.00 to $3.00, according to size.

HUMANIZED VACCINE VIRUS constantly on hand, as heretofore, at same rates as above.

We guarantee success with 95 per cent. of Quill Slips, and, if used with due care and within one week of reception, will duplicate all failures. AUGUSTUS W. WEISMANN, *Chair. Vac. Com.*

Address, **S. S. BOCERT, M.D., Eastern Dispensary,**
57 Essex Street, Station B, New York City.

OF INTEREST TO PRESCRIBERS AND DISPENSERS OF

PEPSIN.

Believing that the confidence of the profession in the practical value of *Pepsin*, as a remedy in various gastric derangements, has been impaired by the use of preparations which do not possess the required digestive power, we have made special efforts to manufacture an article which should command approval by demonstrating its effectiveness in all cases where its employment is indicated.

The SACCHARATED PEPSIN which we now offer is, we believe, equal if not superior to any in the market, foreign or domestic, and of such digestive power that the desired response to its employment may always be depended upon.

We present, with great pleasure, the accompanying flattering testimony by Dr. EDWARD L. DUER, of this city.

We respectfully solicit a trial of our *Saccharated Pepsin* in your practice.

HANCE BROTHERS & WHITE, Pharmaceutical Chemists,

Mailed upon receipt of price, 50 cents per ounce. Office, Callowhill St., cor. of Marshall, Philadelphia.

Messrs. HANCE BROTHERS & WHITE. *Gentlemen*:—Having been much interested of late in the practical value of *Pepsin*, I have had performed a series of experiments, with all the various specimens in general use in this city,—so far as I could ascertain—with the view of *determining their relative merits*. Your own has proven itself *so far superior* to others, that I have thought it due you to state that I found five grains of your Pepsin, in acidulated water, equal to the solution of one hundred and forty-five grains of the white part of hard-boiled egg—against one hundred and fourteen grains, as the next best result obtained from precisely the same treatment, of all the other Pepsins—*some of them dissolving even less than sixty grains.*

Philadelphia, December 7, 1876. Respectfully yours, EDWARD L. DUER, M.D., 1704 Arch Street.

MELLIN'S FOOD

For Infants and Invalids,

FOR USE

Healthful Rearing of Hand-fed Children & the Preservation of Infant Life

AND FOR THE NOURISHMENT OF INVALIDS WHO CANNOT DIGEST ORDINARY FOOD.

Price, $1.00 per Bottle. Trial Size, 60 cents. For Sale by Druggists.

MELLIN'S FOOD IS **ENTIRELY SOLUBLE** AND **NOT FARINACEOUS.**

We will furnish a sample of Mellin's Food free to any physician who may desire to try it in his practice. Send for a pamphlet on "Infants' Food," etc., containing Analysis, Testimonials, etc.

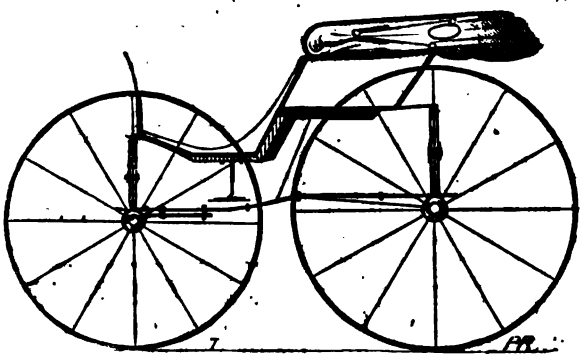
CARRIAGE BUILDERS,

372 and 374 Broome St. (Old Stand of BREWSTER & CO.), **NEW YORK.**

PHYSICIANS' CARRIAGES A SPECIALTY.



PHÆTONS, ROCKAWAYS, BROUGHAMS *And New Style* **PHÆTON-ROCKAWAY**

Having made the various styles of vehicles now in popular use by *Physicians* a leading feature of our business, and being determined to sell

THE BEST THAT CAN BE PRODUCED

At Lowest Prices for Prompt Cash,

We are, therefore, fitting all our Physicians' vehicles and other fine carriages with

THE RUBBER CUSHIONED AXLE.

This great improvement secures the essential objects sought for in every vehicle, viz., **SAFETY, COMFORT,** and **ECONOMY,** and its use indisputably assuring these important and valuable qualities, it is now accepted as an

INDISPENSABLE FEATURE

In carriage building wherever **PERFECTION,** or a near approach to it, is sought to be attained.

Axles in use, where the arms are not much worn, can be altered, using the same wheels if the hubs are sound. Those at a distance may have the alterations made by sending us the axles and wheels only.

SEND FOR ILLUSTRATED CATALOGUE AND PRICE LIST.

HARNESS for PHYSICIANS' USE.

Please mention this Journal.

TO PHYSICIANS.

A large number of the profession in this and other cities now using the

RUBBER CUSHIONED AXLE,

And in some instances, for more than two years, accord it their unqualified endorsement as a means of obtaining relief from the discomfort and fatigue experienced when riding much, or at long distances.

Muffling noise and **rattle, preventing violent dilation of the springs** whereby **motion is lessened, decreasing vibration, jolting** and **pounding, economizing wear** and **tear** at every point, especially upon the wheels, reducing repair bills fully 50 per cent., renders this

APPROVED INVENTION

of the greatest value to all who would ride with **increased safety, absolute comfort, saving money** at the same time.

The improvement is simple in construction and easily applied. The expense is quite insignificant when compared with the gain, not only in largely increased durability of the vehicle, but in horse-power also, traction being reduced from 17 to 25 per cent.

Should your carriage builder be unfamiliar with the mechanical principle of "the axle," or the manner of its application, please send us his name and address, which will receive prompt attention.

By permission, we refer to the following well-known gentlemen now using the "Rubber Cushioned Axle," and, with two exceptions, for periods exceeding fifteen months:

Dr. Edward Bayard, 8 West 40th Street.
Dr. H. P. Farnham, 138 West 23d Street.
Dr. G. A. Peters, 12 West 29th Street.

LEUBE'S MEAT SOLUTION.

Freshly prepared, in one pound glass jars always on hand.

For formula and use see Ziemssen's "Cyclopædia of the Practice of Medicine," Vol. 7, page 233; and Vol. 12, Special Note before Table of Contents; and N. Y. MEDICAL RECORD, Jan. 19, 1878, page 58.

"Of all the meat-preparations the *only reliable* one is Leube's Solution, made by Hoffmann's Formula."
—Dr. E. R. PEASLEE, *Proceed. N. Y. Acad. Medic., Dec.* 20, 1877.

As the Meat Solution does not keep long, its freshness can only be guaranteed by ordering *direct from the manufacturer*. Orders by postal-card or telegraph promptly attended to.

FRED. HOFFMANN, Apothecary and Chemist, Sixth Ave. & 46th St., N. Y.

BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charges in convex surface at square cut end), *20 cents*
Seven " " " " " *$1.00.*
Crusts, each (Hermetically Sealed), ... *2.00.*

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of information may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free.
A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases—such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 82° Fahr. Put up in 8½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

Can be used in any room in the house. 25 per cent. discount to Physicians. Send for Circular.
C. D. HOLMES, 20 Creek Square, Boston, Mass.

SUPERIOR NUTRITION THE LIFE.

IMPERIAL GRANUM.

THE INVENTION OF AN EMINENT FRENCH CHEMIST.

To Physicians and the Public:

This preparation is, in composition, as advertised, principally the Gluten derived, by chemical process, from *very superior growths of wheat*, and should not be confounded with burnt or boiled Flour, in which the Gluten or sanative qualities are destroyed or made medicinally inert, nor with Crushed Wheat, or finely ground Wheaten Grits, styled "Medicinal Food," and sold under various names, in which the starch and impurities contained in wheat are retained in larger quantity.

By Dubisson's formula, the starch, impurities and soluble matter found in the Wheat Cereal are effectually excluded; the Gluten only retained, which is condensed, granulated and prepared to keep in all climates, and justly entitled

IMPERIAL GRANUM.

It is well known, and should be fairly considered, that nothing of merit can b *favorably received and commended by the public without being followed by* imitations of a questionable character. IMPERIAL GRANUM *is not the exception, for no* preparation *has* attracted more attention, *nor been more fiercely imitated, by competition*, even to wording and shipping order.

Whilst again it can be truly said that no preparation ever offered for sale has been more carefully prepared and thoroughly tested, nor has met with a more welcome reception and universal approval, or afforded more relief to invalids or to young and suffering children and aged persons. This has been confirmed by thousands of testimonials from Chemists, Physicians, Heads of Families and the Press.

Respectfully,
E. HEATON,
General Agent for the United States.

SOLD BY DRUGGISTS, AND PHARMACISTS, IN THE *PRINCIPAL CITIES OF THE UNITED STATES.*

Hunyadi János Mineral Water

THE BEST NATURAL APERIENT.

THE LANCET.

"HUNYADI JANOS.—Baron Liebig affirms that its richness in aperient salts surpasses that of all other known waters."

THE BRITISH MEDICAL JOURNAL.

"HUNYADI JANOS.—The most agreeable, safest and most efficacious aperient water which has been brought under our notice."

From Prof. MACNAMARA, Prof of Materia Medica, Royal College of Surgeons in Ireland; Editor of "Neligan's Medicines, their Uses," &c., 7th edition.

"Far the most valuable and palatable of our Aperient Mineral Waters. I have been most agreeably surprised with the result of a clinical investigation."

From Professor AITKEN, F.R.S., Professor of Pathology, Army Medical School; Author of the "Science and Practice of Medicine," *6th edition.*	"Those who have used Pullna and Friedrichshall prefer the Hunyadi János Water to either, because the bulk of the dose is less than either of those waters, and the action is less drastic, producing no distress or uneasiness."
From Professor T. LAUDER BRUNTON, F.R.S., Professor of Materia Medica and Therapeutics at St. Bartholomew's Hospital; Examiner in Materia Medica, University of London.	"More frequently prescribed than any other by Physicians in the General Hospital, Vienna: its taste being more pleasant than that of its rivals, while its efficacy as a purgative equaled or surpassed theirs."
From Professor Dr. VIRCHOW, Director of the Pathological Institute, Berlin.	"I have tried the Hunyadi János water sent me on a large number of persons, with invariably good and prompt success. It is a most valuable item in our Balneological treasury of remedies."
From Professor Dr. von BAMBERGER, Director of the Medical Klinik in the University of Vienna.	"I have prescribed the Hunyadi János waters with remarkable success in all those diseases for which aperient waters are used."
From Professor Dr. SCANZONI (von LICHTENFELS), Professor of Medicine in the University of Wurzburg.	"After having made a large number of experiments extending over many years, I prescribe none but this."
From Dr. J. MARION SIMS, Consulting Surgeon of the Women's Hospital, New York, Honorary Fellow of the Obstetrical Societies of London, Dublin and New York.	"As a laxative, I prefer the Hunyadi János to any and every other mineral water, and for the following reasons: The dose is small; the taste is not unpleasant; it acts promptly; it does not oppress the stomach; it does not gripe, and it is efficient."
From Dr. FORDYCE BARKER, Professor of Clinical Midwifery and Diseases of Women, Bellevue Hospital, New York.	"It requires a less quantity: that it is less disagreeable to the taste; less unpleasant in its efficient action, and more certain as an aperient, than any of the waters that I have before been accustomed to prescribe."
From Dr. von BUHL, Professor of Medicine in the University of Munich.	"Among all known aperient waters, the Hunyadi János water indisputably occupies the first position."
From Dr. JAMES R. WOOD, Emeritus Professor of Surgery in Bellevue Hospital Medical College, and Surgeon to Bellevue Hospital, New York.	"It is generally a certain but gentle and painless aperient. In my experience it is superior to any other Bitter Water."
From Dr. WILLIAM A. HAMMOND, Professor of Diseases of the Mind and Nervous System in the University of the City of New York.	"According to my experience, the most pleasant and efficient of all purgative mineral waters."
From Dr. ALFRED L. LOOMIS, Professor of Pathology and Practice of Medicine in the Medical Department of the University of the City of New York; Visiting Physician to Bellevue Hospital.	"The most prompt in its action and the most efficient of any of the aperient mineral waters. Specially adopted to those persons who daily require the aid of cathartics."

For ordinary aperient purposes a half wine-glassful of the Hunyadi Water may be taken at bed-time, or a wine-glassful taken in the morning fasting. It is most efficacious when warmed to a temperature not below 50° or when an equal quantity of hot water is added to it.

Every genuine bottle bears the name of the Apollinaris Co., Lim., London, England.

MAY BE ORDERED OF ALL DRUGGISTS, GROCERS & MINERAL WATER DEALERS.

APOLLINARIS WATER.

From R. OGDEN DOREMUS, M.D., LL.D.,

Professor of Chemistry and Toxicology in Bellevue Hospital Medical College and Professor of Chemistry and Physics in College City of New York.

Last Summer our Croton Water was remarkably polluted. It teemed with animalculæ; its odor was uninviting; its taste was unpalatable; and its effects upon the system unwholesome. Unfortunately this has occurred each warm season, and will happen in a more or less marked degree every Summer.

It is well known that many cities suffer from impure water.

Eminent physicians in Albany attribute the increased sickness and mortality in the capital of our State to the water supplied from the Hudson River.

In rural districts, the drainage from the residence frequently contaminates the well water to such an extent as to produce prostration and death. Many ingeniously devised filters have been presented to the public; they are effective in removing certain objectionable particles, but the impurities of the most vital importance still remain.

The delusion applies also to aerated waters, which to the eye appear transparent and sparkling, yet at times are magazines of disease.

I find on careful examination that the *Apollinaris Water is entirely free from all such organic impurities.*

Its freedom, also, from metallic poisons already referred to enables the chemist to coincide with eminent medical authorities in commending it as an *absolutely pure, wholesome, as well as pleasant mineral water, superior to all others as a daily beverage.*

APOLLINARIS WATER—"Far superior in flavour and quality to ordinary manufactured aërated waters, and useful in preventing gouty and dyspeptic disorders."—*The Practitioner.*

APOLLINARIS WATER—"The favoured drink of the favoured classes."—*London Medical Record.*

APOLLINARIS WATER—"An article of diet, alike refreshing, agreeable, and of great value."—JAMES PALFREY, M.D., Obstet. Physician to London Hospital, etc., etc.

APOLLINARIS WATER—"Exhilarating; good for loss of appetite, nausea, and dyspepsia."—*Companion to the British Pharmacopœia*, by PETER SQUIRE, F.L.S., Chemist to the Queen.

APOLLINARIS WATER—"Incomparable for mixing with Wines and Spirits."—H. VIZETELLY, British Wine Juror at the Vienna Exhibition.

APOLLINARIS WATER—"Far superior to ordinary aërated Waters."—*Medical Times and Gazette.*

APOLLINARIS WATER—"Highly estimated by those who have made Aërated Waters a study."—*Medical Press.*

APOLLINARIS WATER—"The type of purity."—Professor BARTLETT, F.C.S.

APOLLINARIS WATER is strongly recommended by Dr. PETER HOOD, as superior to Vichy and Vals."—*Treatise on Gout and Rheumatism.*

APOLLINARIS WATER—"I have used the water myself for above a year and a half. It is a most refreshing beverage, highly restorative, and well adapted to relieve most of the dyspeptic constitutions that English stomachs are so peculiarly liable to."—JAMES BIRD, F.R.C.S.

APOLLINARIS WATER—"The water contained in the glass bottle, doubly charged, is, in my opinion, far superior to the seltzer water supplied to us in England. For dyspeptic, rheumatic, and gouty subjects, I consider it a very valuable beverage, taken either with sherry, brandy, or gin."—G. BOWLASE CHILDS, F.R.C.S., Surgeon to the City of London Police.

APOLLINARIS WATER—Dr. Hermann Weber, F.R.C.P., writes:—"Having largely used it during the last seven years, I have found it of great value as an article of diet in gouty dispositions, in lithic-acid disthesis, in tendency to gallstones, in some forms of catarrh of the bladder, and in chronic catarrh of the respiratory organs; in the latter, either treated by itself or mixed with hot milk or hot whey. To many persons the Apollinaris forms an agreeable and useful addition to bitter waters, and a good vehicle for some medicines."

APOLLINARIS WATER—"I have personally derived immeasurable advantage from the use of Apollinaris Water, and I have recommended it in my professional capacity very largely to my patients. Its use to myself has been most remarkable, and the testimony of very many to whom I have suggested its use is highly eulogistic of its effect upon them."—GEORGE TATHAM, M.R.C.S., England; L.S.A., J.P., Brighton, formerly Surgeon North Devon Hospital.

APOLLINARIS WATER—"A pleasant beverage, agreeably effervescent, and tenacious of its gas. It is also a very safe and gentle antacid. I hope it will meet the popularity it deserves."—JAMES MORRIS, M.D., London, Fellow of University College.

FOOD IS THE BEST TONIC!!

TRADE MARK.

MENSMAN'S

PEPTONIZED

BEEF TONIC.

The great necessity for a fluid food that would possess **all the elements necessary for the support of the system**, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared for us by reliable and competant parties after a thoroughly tested and scientific method.

SPECIAL NOTICE.

In all cases where it is possible, the Prescriptions and Med cines dispensed at my Pharmacy are compounded from the products of the laboratory of Dr. E. R. SQUIBB, of Brooklyn, thus insuring to both physician and patient, Med cines whose purity of quality, and reliability of character, are above suspicion.

Being very desirious of receiving the full confidence of Physicians of this city, I shall ever strive to deserve the same by keeping in my Pharmacy only **Medicines of the Finest Quality and Strictest Purity.** The careful dispensing of Physicians' Prescriptions is the **Leading Feature** of my business.

Physicians in all cases can rely on obtaining, in their Prescriptions, **just what Medicines they Prescribe, and none other,** as no substitution is allowed without first consulting the Physician.

PHYSICIANS CAN ALWAYS FIND AT MY PHARMACY

EVERY SINGLE ARTICLE that is made by Dr. Squibb.

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permaneney of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

Pullna Bitterwater.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

PRICE.—Case of 20 Pint Jugs.....$3.25 by
" Case of 50 Pint Jugs..... 8.00 "
Less discount according to quantity.

FOR SALE BY ALL DRUGGISTS.

Quotations for quantities may be had, as well as circulars, free from

IMPORTERS OF

PULLNA and all other EUROPEAN MINERAL WATERS,

72 & 74 Park Place, New York.

WARBURG'S TINCTURE.

Made from the original recipe of Dr. Warburg and used as a specific in malarious fevers and all diseases arising from malaria. This preparation is recommended by the English Government, and extensively used in all the English military hospitals, particularly in the East Indies. (see London *Lancet*, Nov. 13, 1875.)

Please specify, in ordering from any wholesale house, **Warburg's Tincture,** made by **F. A. REICHARDT.**

Price per bottle, 1 oz., **75c.**; per doz., **$5.00.** Per pint, **$5.00**; per doz., **$50.00.**

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynaecologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. **$1.00** per dozen, sent by mail. Orders executed by return of mail.

P. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ½ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. **90c.** per dozen; **$10.00** per gross.

F. A. REICHARDT, Pharmacist,

404 Fourth Avenue, corner 28th Street, New York.

Advanced students will be intrusted with the care of cases. Applicants for graduation will be required to perform operations upon the cadaver. An abundant supply of dissecting material constantly on hand.

FEES.—For the entire Course, $80.00. Matriculation Ticket, $5.00. Demonstrator's Ticket, $5.00. Graduation Fee, $25.00. For further information, address W. F. PECK, M.D., Dean, Davenport, Iowa,
Or, ELMER F. CLAPP, M.D., Sec'y, Iowa City, Iowa.

N. H. MEDICAL INSTITUTION AT
DARTMOUTH COLLEGE.

The *Eighty-second* Annual Course of Lectures begins Aug. 1, 1878, and continues fourteen weeks. Recitations from Dec. 5 to June 20.

FACULTY:—H. H. Phelps, M.D., LL.D., Practice Emeritus; A. Smith, M.D., LL.D., Therapeutics Emeritus; O. P. Hubbard, M.D., LL.D., Chemistry; E. R. Peaslee, M.D., LL.D., Gynecology; J. Gridronaux, M.D., LL.D., Medical Jurisprudence; C. P. Frost, M.D., Practice; P. S. Conner, M.D., Surgery; E. S. Dunster, M.D., Obstetrics; H. M. Field, M.D., Therapeutics; L. B. How, M.D., Anatomy and Physiology.

FEES:—Matriculation, $5; Lectures, $77; Graduation, $25; Recitations, $40.

For Circular, address C. P. FROST, M.D., Dean, Hanover, N. H.

MEDICAL DEPARTMENT OF
HARVARD UNIVERSITY,
BOSTON, MASS.

NINETY-FOURTH ANNUAL ANNOUNCEMENT. (1877-78.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 27th, 1877, and ends the last Wednesday in June, 1878. Persons who hold no degree in arts or science must hereafter pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 24th.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing

DR. R. H. FITZ, Secretary, 108 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF
YALE COLLEGE.

Spring Term begins March 1, and closes June 28, 1877.

Winter Term begins October 4, 1877; closes January 31, 1878.

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $5.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing

H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar.

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1877, and continue twenty-one weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

WM. H. BYFORD, A.M., M.D., President.
T. D. FITCH, M.D., 296 West Monroe St., Secretary.
CHAS. W. HARLE, M.D., 57 Park Ave., Treasurer.

TO PHYSICIANS.
THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving results of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

MEDICATED DISCS
For Hypodermic Injection.

SPECIAL NOTICE.

Messrs. **SAVORY & MOORE** beg most respectfully to inform the MEDICAL PROFESSION generally, that the great demand which has arisen for their **GELATINE PREPARATIONS**, since they were first introduced, has compelled them to extend their Laboratory in New Bond Street, by the erection of a Department for the exclusive purification and manipulation of these articles. The discs for **HYPODERMIC INJECTIONS**, and for **OPHTHALMIC PURPOSES**, as well as the **LAMELS FOR INTERNAL USE**, will henceforth be prepared under the **immediate supervision of the Firm.** This Special Department is so arranged that the delicate process of manufacturing the Sheets of Gelatine cannot possibly be interfered with, and consequently the **perfect purity** and **accurate dosage** of these important and delicate preparations may be **THOROUGHLY RELIED ON.**

The HYPODERMIC DISCS are now sold in boxes, which have been found to be of greater advantage for their preservation than the leather wallets originally employed.

SAVORY & MOORE, 143 New Bond St., LONDON, ENGLAND.

SAVORY & MOORE

Beg to call the attention of the Profession to some of the Later Preparations brought out in England, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION.

Prepared in accordance with the direction of the Physician who introduced this Pure Drug as

A REMEDY for CONSUMPTION and WASTING DISEASES.

In the above-named diseases, or in cases where there is an unfortunate tendency to these distressing complaints, the introduction of fatty matter into the system, in some manner, is admitted by all Medical Authorities to be an **absolute necessity.** When Cod Liver Oil fails to increase weight, or cannot be tolerated by the stomach, Pancreatic Emulsion is the only remedy which can supply its place, and it may also be given in conjunction with the Oil, as it has the power of digesting it.

PANCREATINE.

An almost tasteless powder, readily taken with water, milk, wine, etc. It possesses the active properties of the Pancreatic Juice, and is an important aid to the digestion and assimilation of starch, albuminoids, and fatty substances, such as Cod Liver Oil.

PEPTODYN, the New Digestive,

Is a combination of the whole of the digestive secretions, forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition. Peptodyn is intended as a general promoter of digestion for persons not necessarily considered in bad health; thus, when taken about a quarter of an hour after a meal, it will be found to assist digestion in a remarkable manner, and prevent the discomfort which often follows the partaking of a full meal by persons in good health.

AS SUPPLIED TO

THE ROYAL NURSERIES,

AND CONTAINING THE

Highest Amount of Nourishment

IN THE

MOST DIGESTIBLE AND CONVENIENT FORM.

This Food resembles Mother's Milk more closely than any other kind, perfectly fulfilling its object—that of promoting the **growth** and **health** of the Child.

DATURA TATULA, for Asthma,

HAY FEVER and **CHRONIC BRONCHITIS.** Recommended by the Profession as a remedy of great power and usefulness in cases of short and difficult breathing, spasmodic coughing, etc. Prepared in Cigarettes, and in the form of Tobacco; also Powder and Pastilles for Inhalation.

SAVORY & MOORE, 143 New Bond Street, LONDON, ENGLAND.

TOTAL ABSTINENCE SAVING WINE TILL IT RIPENS.

There is a curious story about some native wines which are extensively advertised nowadays, and have only recently been put upon the market. Dr. Underhill, the well-known grape-grower of Croton Point, died in 1871. Some of his heirs entertained temperance views of such extreme kind, that they were unwilling to allow the stock of wines then on hand to be sold or any more to be made. The grapes have sometimes been sent to market, and sometimes left to decay upon the vines. It is only now that the other heirs have succeeded in arranging for a settlement of the estate and the sale of the wines on hand. Among these is a wine of the vintage of 1864, described as a "Sweet Union Port," but suggesting the Imperial Tokay more than any other European wine, and being wholly unlike any other wine of American growth. Its purity, age and mellowness are remarkable, and both physicians and wine-fanciers have a special interest in it as the oldest native wine now accessible in any considerable quantity. The whole stock is in the hands of the well-known wholesale grocery house of the Thurbers.—*N. Y. Tribune, Nov.* 19, 1877.

The above speaks for itself; but we would add that this is the pure juice of the grape, neither *drugged, liquored* nor *watered;* that it has been ripened and mellowed by age, and for medicinal or sacramental purposes, it is unsurpassed. It can be obtained from most of the leading Druggists throughout the United States, and at wholesale from the undersigned, who will forward descriptive pamphlet, free of charge, on application.

Respectfully, etc.,

H. K. & F. B. THURBER & CO.,

West Broadway, Reade and Hudson Sts.,

NEW YORK.

OF

SURGICAL

AND

ORTHOPEDICAL

INSTRUMENTS,

Anatomical Preparations,

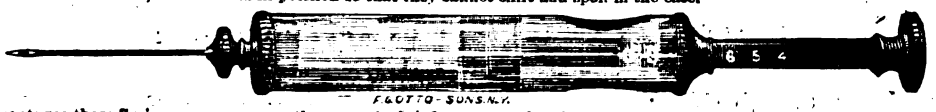
SKELETONS, &c.

Trusses, Abdominal Supporters, Elastic Stockings, &c., &c.

No instrument is used as often as the Hypodermic Syringe, and consequently they frequently get out of order. To furnish to the profession an instrument which can easily be kept in good working order, and which can be easily repaired, is our object of describing the following:

The instrument has two canulas of steel, either gilt or nickel-plated; will not oxidize; they are tempered, and have an easily-introduced lance-shaped point, which can be easily sharpened. The diameter of the canula is ½ mm.

The Syringe is contained in a neat Hard Rubber case, the lower part of which holds the Syringe, and a vial of 5 grammes' capacity. The needles are placed in the cover, and are held in position so that they cannot shift and spoil in the case.



The advantages these Syringes possess over others may be briefly summoned as follows:

The construction of the cylinder out of hard rubber or glass, and the simple manner in which the different parts can be attached to another.

The construction of the stopple and the method of filling.

The manner in which the canulas are held in the case.

Dr. GAILLARD T. THOMAS, after examining the above instrument, pronounced the same to be one of the best improvements made in instruments since years.

Dr. G. R. PATTON, Lake City, Minn., writes: "The Hypodermic Syringe came while I was away; I am pleased with it beyond expression.

PRICES.

The syringe with glass cylinder	$5 00
The syringe with glass cylinder, in a nickel-plated case, without a vial; very compact	3 50
The syringe with hard rubber cylinder	4 50

THE BOSTON

MEDICAL AND SURGICAL JOURNAL

ESTABLISHED 1828.—PUBLISHED WEEKLY.

THE Publishers of THE BOSTON MEDICAL AND SURGICAL JOURNAL wish to call the attention of physicians to certain special features of this journal which make it exceptionally valuable as a medical periodical, and which commend it to the favor of professional gentlemen throughout the United States.

1. It is a weekly publication, thus possessing obvious advantages for the prompt presentation of medical intelligence, a great part of whose value lies in its freshness.

2. Being the only medical publication in New England, it possesses unusual opportunities for obtaining contributions to its pages, and is able to combine the special advantages of both a weekly and a monthly journal.

3. It contains *nothing* but original material. There are no borrowed articles, the current literature of the day being represented, in a manner peculiar to this journal, by a series of reports by experts in special departments of medical science, who give comprehensive and critical summaries of the most recent advances in their respective branches, and who constitute undoubtedly the strongest corps of the kind in the country.

4. It gives special attention to the department of reviews, which are fuller and more carefully prepared than in most medical journals.

5. Reports are received from a large number of medical societies, representing all departments of medicine. The facilities for obtaining clinical contributions from hospital practice have been greatly enlarged, embracing the most important hospitals of New England.

6. The correspondents' department has been organized with great care, and the chief medical centres of the world are here represented. A letter from one of these places appears in each issue of the JOURNAL.

7. A weekly table, showing the comparative mortality rates for the week, of thirteen large cities in the United States.

8. Editorially the JOURNAL aims to represent the profession of the whole country. It is one of the pioneers of medical science in the country, being, with one exception, the oldest now in existence. It was originated and has been maintained by no school or interest whatever beyond that of the science and practice of medicine and the medical profession.

The Editors and Publishers will spare no pains to keep the JOURNAL in the high and honorable position which it has so long occupied among American medical periodicals.

EDITOR.—DR. J. COLLINS WARREN.

EDITORIAL STAFF.—DR. A. D. MASON, DR. C. F. FOLSOM, DR. GEORGE B. SHATTUCK.

EDITORIAL REPORTERS.—DR. G. W. GAY, DR. F. W. GOSS, DR. HAMILTON OSGOOD.

DR. H. P. QUINCY, ANATOMICAL DRAUGHTSMAN.

THE REPORTERS ON MEDICAL PROGRESS in Anatomy, Chemistry, Dentistry, Dermatology, Diseases of Children, Diseases of the Throat and Chest, Electro-Therapeutics, Gynæcology, Materia Medica, Mental Diseases, Military Surgery, Obstetrics, Ophthalmology, Orthopedic Surgery, Otology, Pathology, Physiology, Public Hygiene and Forensic Medicine, Surgery, Syphilis, Theory and Practice of Medicine, and Genito-Urinary Surgery, comprise the principal Professors in the Medical School of Harvard University, and the leading Physicians and Surgeons in the Massachusetts General Hospital, Boston City Hospital, and Boston Lying-in Hospital.

TERMS.—*Five dollars a year*, payable in advance; single numbers *fifteen cents*. *Postage in all cases is paid by the Publishers.* Remittances may be made by draft, money-order, or registered letter to H. O. HOUGHTON & Co., *Riverside Press, Cambridge, Mass.*

A Compend of Diagnosis in Pathological Anatomy

With Directions for Making Post Mortem Examinations. By Dr. JOHANNES ORTH. Translated by G. K. SABINE, M.D., and F. C. SHATTUCK, M.D. Revised by R. H. FITZ, M.D. In one volume, 8vo, cloth, $3.50.

In issuing a translation of this recent German work, the publishers have been convinced of its great practical value to all medical students. The directions for making an autopsy are given with great thoroughness and precision; the means of recognizing the various changes which may be found on the different parts of the body are briefly stated in a systematic manner, and the medico-legal bearing of the results of the investigation are always carefully attended to. The description of the gross appearances is also supplemented by thoroughly practical directions in the use of the microscope, when important additional information becomes necessary for exact diagnosis.

Dr. Orth was formerly the assistant of Professor Rindfleisch, and at present holds a like position under Professor Virchow. The teaching which he offers is consequently that of the highest authorities in the very centre of modern investigation in this department of medicine.

The Publishers are the more desirous of calling attention to the translation, as it contains, through the kindness of the author, such additional information and corrections as he has prepared for the second edition of the original work, hereafter to be published. They have received many letters from prominent physicians and surgeons, warmly commending the book, and among them the following:

COLLEGE OF MEDICINE, SYRACUSE UNIVERSITY,
SYRACUSE, N. Y., *December* 5, 1877.

Every physician should carefully read the admirable work of Prof. Orth on "Diagnosis in Pathological Anatomy." For this book teaches —what so few know—how to make a neat *post-mortem*. Prepared by a pupil of Virchow, the greatest pathologist in the world, it is not only fascinating, but authoritative on all points which it discusses. Cleverly translated, the book is one of the best additions to the best recent medical literature. I thank you for the copy sent me. I heartily commend it to my classes, and to my professional brethren here and everywhere.

H. D. DIDAMA.

PHILADELPHIA, *December* 7, 1877.

I have delayed the acknowledgment of the handsome translation of Orth's "Diagnosis in Pathological Anatomy," which you so kindly sent me, until I had time to read it carefully. Its clear and brief, but comprehensive, descriptions of the downright facts of pathology are almost unsurpassed, and although I am at present teaching normal histology, I shall have and use many opportunities of recommending this work to our students.

JOS. G. RICHARDSON.

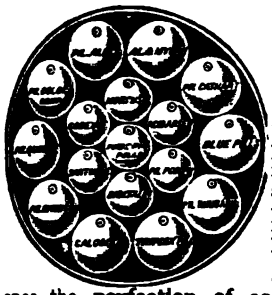
Printed Pills and Granules



These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the perfection of accuracy, and a safeguard against mistakes or substitution. Their claim to the confidence of the medical profession and pharmacist rests on the entire purity of the ingredi nts used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal:

Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

Th ...pills are sold in bottles of 100 and 500. Other pills will be adde ...nd special formulæ made to order. Descriptive lists, giving men ...nt and prices, also samples, sent on application.

LAZELL, MARSH & GARDINER'S
POWDERED
MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts.*

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

DR. BULKLEY

WILL CONTINUE HIS PRACTICAL EXPOSITIONS OF

DISEASES OF THE SKIN,

WITH CLINICAL LECTURES,

AT THE

DEMILT DISPENSARY, NEW YORK,

Corner Second Avenue and Twenty-third Street.

ON

Tuesday, Thursday and Saturday Afternoons, from 2.30 to 4 o'clock.

Fee for the Course of Two Months, . . $10.00
Number in each Course limited to ten.

Dr. Bulkley would refer to the following physicians, who, with others, have attended one or more Courses during the last two years:

Arthur W. Bower, Waterford, O.
A. F. Burdick, Underhill, Vt.
Robt. Campbell, New York City.
T. M. Cheesman, New York City.
Geo. W. Duryea, Hempstead, L. I.
J. B. Emerson, Univ. of Va., Va.
W. E. Forrest, Burlington, Vt.
T. W. Fullilove, Vaiden, Miss.
L. J. Gibbs, Epping, N. H.
J. W. Grizard, Winchester, Tenn.
W. J. Haine, Farmington, Ohio.
H. C. Hill, Somerset, N. Y.
H. H. Hogan, Reno, Nevada.
S. H. Hurd, New York City.
Howard E. Jones, Circleville, O.
F. N. McGuire, New York City.
R. Robinson, Killingly, Conn.
W. H. Saylor, Forest Grove, Ore.
E. P. Smith, Brooklyn, N. Y.
H. S. Strickland, Ashtabula, O.
J. O. Tansley, New York City.
W. H. Taylor, San Francisco, Cal.
Robt. Wadsworth, Rochester, N.Y.
J. J. Williams, New York City.
W. P. Worster, New York City.

BELLEVUE HOSPITAL
MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D, Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMITH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

MESSRS. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

THE MANUFACTURERS,

KEASBEY & MATTISON,

332 N. Front Street, Philadelphia.

SUPERIORITY OF
WARNER & CO.'S
SUGAR-COATED PHOSPHORUS PILLS.

(Twenty-Four Combinations.—See List.)

For EFFICACY, PERFECTION, and FREEDOM from harm, this make of Pills of Phosphorus is unrivalled. The process originated and perfected by W. R. WARNER & Co., for the administration of Phosphorus in pill form, diffuses the Phosphorus, in its elementary state, thoroughly through the mass in a state of solution, a result by no other process attainable. The value of Phosphorus as a remedial agent is impaired if the element is not exhibited in its free state, and protected from oxidation by a perfect and *non-porous coating of pure white sugar.* You are cautioned to avoid cheaper and inferior brands.

Messrs. WM. R. WARNER & Co., *Manufacturing Chemists, &c.*

GENTLEMEN:—The Phosphorus Pills* submitted to me for Chemical Analysis and Microscopic Examination afford only traces of Phosphoric Acid, and contain the one twenty-fifth of a grain (gr. 1-25) of the element in each Pill, as expressed upon the label; they do not exhibit particles of undivided Phosphorus, the mass being perfectly homogeneous in composition, soft in consistence, and thoroughly protected by the non-porous coating of sugar from the oxidizing influence of the air. Each Pill is an example of what skill, care, and elegant Pharmacy can do. I regard them as a marvel of perfection.

Very respectfully,
A. E. McLEAN, *Analytical Chemist and Microscopist,*
40 and 42 Broadway, N. Y.

Late of Gardner & Ainslie's Laboratory, Edinburgh, Scotland.

DISEASES OF THE NERVOUS SYSTEM.

A Lecture Delivered in Bellevue Hospital Medical College, Dec. 1, 1877.

By C. E. BROWN-SÉQUARD, M.D.

(Reported for The Medical Record.)

SYMPTOMS DUE TO PARALYSIS CAUSED BY DISEASE IN THE CEREBELLUM (*continued*)—DISORDER OF MOVEMENT—RELATION BETWEEN THE CEREBELLUM AND THE SEXUAL ORGANS—GENERAL PARALYSIS—DISEASE IN ONE SIDE OF THE CEREBELLUM AND IN THE SIDE OF THE BRAIN OPPOSITE—PARALYSIS CAUSED BY DISEASE IN THE CRURA CEREBRI—EFFECT PRODUCED UPON THE THIRD AND UPON THE SIXTH PAIRS OF NERVES—EFFECT PRODUCED UPON THE OPTIC NERVE—EFFECT PRODUCED UPON THE TUBERCULE QUADRIGEMINA BY DISEASE IN THE CRUS CEREBRI—DISORDER OF MOVEMENT—THE CORPORA STRIATA AND THE OPTIC THALAMI—NOTE OF THE THEORY THAT A PART OF THE CORPUS STRIATUM POSSESSES THE POWER OF THE WHOLE—DIFFICULTY IN DIAGNOSIS OF THE CAUSE OF PARALYSIS WHEN THE LESION IS SITUATED IN THE CORPUS STRIATUM—SYMPTOMS OF HEMORRHAGE INTO THE CORPUS STRIATUM—SYMPTOMS OF DISEASE IN THE OPTIC THALAMI—CHANGE IN REFLEX FACULTY—PARALYSIS OF BLOOD-VESSELS—AMAUROSIS PARALYSIS CAUSED BY LESIONS IN THE CENTRUM OVALE.

Gentlemen:—In my last lecture I gave you the symptoms usually present when there is paralysis caused by disease in the cerebellum. I shall to-day conclude what I have to say relating to that question. You may remember I said that when there is disease in the cerebellum there is very frequently disorder in movements of the body, and I characterized that disorder as one similar to what is observed in the movements of a drunken man. Lately, Professor Carpenter, who for a long time admitted the view that the cerebellum is the nervous centre for muscular sense, has, in consideration of experiments published by Ferrier, which seem to show that the cerebellum is a centre for the movement of the eyes, modified that view and come to conclude that if disease in the cerebellum produces disorder in the movements of the body, it must be on account of the instability of the muscles of the eye. You can easily understand that a man whose eyes are constantly oscillating, sees things before him constantly in motion. In consequence of this you can easily understand that such a man will have the same disorder in his movements as he sees in objects which surround him. The peculiar agitation, however, which exists in cases of disease of the cerebellum cannot be explained in that manner, for, if it were true, we should find the disorder of movement ceasing as soon as the eyes are closed. Although it is so, in certain cases, yet in most cases of disease of the brain there is no pretence whatever that disorder of movements in the limbs, have the limbs as the centre of the trouble. Galvanization of certain parts causes movements of the eye, but it is believed that by far more frequently what is observed there is due to reflex influence. Just the same thing has been produced by tickling the soles of the feet, causing movements of the muscles of the face, but we do not conclude that the centre which governs the movements of the muscles of the face is in the sole of the foot, and the same method of reasoning leads us to deny that the part galvanized is the centre which presides over the movements of the muscles of the eye. After canvassing five or six hundred cases of disease of the cerebellum, I do not find mention made of any trouble in the eyes of the patient in a majority of them, and in most of the minority in which any mention was made with reference to the eyes, it was simply to say that there was no trouble there. It is only in a trifling number of the cases that there has been any eye trouble at all, and the trouble, when present, varies immensely. In some cases there has been strabismus in one or other of the eyes; in other cases, other troubles, so that we have seen the greatest variety of effects produced upon the eye in disease affecting the cerebellum. It is certain, however, that a peculiar disorder of movement is somewhat frequent in these cases.

There are two other peculiar features which have also been observed in disease of the cerebellum, as regards disorder of movements. These two features, frequently, are just the opposite, one from the other; just that, however, may come from disease in the same part of the brain. There are cases on record in which a deposit of tubercles in the same part of the cerebellum, the central portion on the left side and very nearly of the same dimensions, one of which was accompanied by a tendency on the part of the patient to run forward, and in the other a tendency to go backward. Indeed, as you find disease in the same place in the brain in an immense number of cases without such movements, you cannot admit that there is any peculiar power then to produce direct movement forward or backward, or sideways, for disease in the cerebellum may produce a rotary movement, as well as movements backward and forward. All these varieties of movement you can also find in connection with disease located in other parts of the brain; so you are not to look upon them as anything essential, although, perhaps, they occur more frequently with disease in the cerebellum than with disease elsewhere in the brain. Rotary movements form an exception to this rule, for they occur more frequently from affections of the pons varolii, just at the place where the crus comes into it, or in connection with disease in the crus itself, than in disease in the cerebellum. But other parts have that power; as disease of the suprarenal capsule has been known to produce rotary movement, and so has disease of the auditory nerve without organic disease in the brain, produced the same phenomenon. We have the remarkable case of the Duke of Wellington, who received at the hands of a quack an injection of a strong solution of nitrate of silver into one of his ears; the Duke rotated with great rapidity, and the man not being satisfied, repeated the injection the following day, and produced the same rotary movement of the body. Such a movement can be developed, therefore, not only by disease in the cerebellum, but by disease in many other parts of the nervous system.

RELATION BETWEEN THE CEREBELLUM AND THE SEXUAL ORGANS.

To continue what I have to say, I have to mention a fact which has been the subject of great discussion, and that is, the influence which, as has been supposed, the cerebellum exerts upon the sexual organs. It has been said that the cerebellum is the nervous centre which presides over sexual desire. Certainly there are cases in which, that organ being diseased, there has been loss of sexual power. At the same time, just the reverse may be true, and with inflammation affecting those parts, there may be an increase of sexual

power and desire. Inflammation affecting the cerebellum may cause either loss or increase of sexual power. Still more, examination of an immense number of cases brings us to the conclusion that there is no definite relation between sexual power and the cerebellum. For, an immense number of cases are found in which there was no change whatever in sexual power and desire, although the cerebellum was extensively diseased. There is upon record a most remarkable case, which goes to establish what I have been saying. It was a case in which there occurred the most important destruction of the cerebellum known; there was no trace of the cerebellum found at autopsy, and the pons varolii was very much diminished in size, due to absence of the fibres, which go into the cerebellum. In that case, if the cerebellum is the nervous centre that presides over the sexual organs, there would have been present phenomena which are quite different from what was developed, for the patient, a girl, was addicted to masturbation, to a most wonderful degree. We cannot say that her excessive sexual desire was due to irritation in the cerebellum, for that portion of the brain was entirely absent. In that case there was, on the one hand, an entire absence of the cerebellum, and on the other, there was constant sexual excitement. If the cerebellum is the nervous centre for the sexual organs, these two facts cannot be reconciled.

GENERAL PARALYSIS IN CASES OF DISEASE OF THE CEREBELLUM.

I pass now to other points relating to the cerebellum in connection with paralysis, and to one in particular, which is a most important point, as it relates to paralysis itself.

I have said that if the cerebellum has any function, at least which I know of, it is a producer of nerve-force. The only thing, I repeat, which, to my knowledge, is constant in cases in which there is considerable alteration in the cerebellum, is diminution of strength in all parts of the body without reference to the localization of the disease; it may be in one lobe or the other, upon the surface, or in the central part of the cerebellum. There is something like a general paralysis in cases of considerable disease in the cerebellum; but besides this the variety of localized paralysis which may be developed is extremely great.

PRESSURE UPON THE PONS VAROLII.

There is no doubt that, in most cases in which localized paralysis appears when there is disease in the cerebellum, it is due to pressure produced upon the pons varolii. In those cases the paralysis, almost invariably, is upon the opposite side of the body. You will find this particularly in cases in which the disease in the cerebellum is able to exert considerable pressure; it is especially marked where there is great hemorrhage into one lobe of the cerebellum, necessarily giving rise to pressure upon the pons varolii beneath it.

The same thing may occur in cases of considerable tumor in the cerebellum, producing pressure upon the pons varolii, and in these cases the paralysis is due to an effect produced upon the pons varolii in reality, and to an effect produced upon the cerebellum in appearance. But disease of the cerebellum certainly can produce paralysis. There are cases in which limited disease in the back part of the cerebellum has been accompanied by paralysis, either upon the same side or upon the opposite side of the body. There are cases in which slight softening in the cerebellum has been attended by localized paralysis, and certainly we cannot admit that in such cases the paralysis was due to pressure upon the pons varolii. All forms of localized paralysis may arise from disease in the cerebellum that can scarcely be supposed to exert pressure upon the pons varolii. There may be paralysis affecting the face, the tongue, or any part of the body. Still, as a rule, you will find hemiplegia, caused by disease in the cerebellum, existing without paralysis of the tongue or of the face. Now, if you have a patient stricken down with apoplexy, showing symptoms of hemorrhage into the brain, consisting of hemiplegia, loss of consciousness, difficulty of breathing, coma, etc., which generally accompany hemorrhage in the encephalon—if you have these symptoms, and you find there is no appearance of facial paralysis, no appearance of paralysis of the tongue; and if you find, after the patient has recovered from the first effects of the blow, that there is vomiting, amaurosis, or diminution of sight, and considerable headache, you can, with a great probability of being correct, say that there has been hemorrhage into the cerebellum. If the patient also has some disorder of movement accompanying his hemiplegia, you have another reason for believing that the disease is in the cerebellum.

DISEASE IN ONE SIDE OF THE BRAIN AND IN THE CEREBELLUM ON THE OPPOSITE SIDE.

There are other features which are extremely striking with regard to paralysis in connection with disease in the cerebellum. It has been pointed out by Andral that when there is disease on one side of the cerebrum, and also on the opposite side of the cerebellum, you are to look for paralysis upon the side corresponding with the disease in the cerebellum. This is true in nearly all the cases, whether there is softening or hemorrhage, or some other disease. There are exceptions, however, and I know of two such cases. In one of these there was a deposit of tubercles scattered in the anterior and middle lobes of the brain upon the right side, and also tubercles on the left side of the cerebellum; in this case there was paralysis upon the right side of the body, upon the side corresponding to the seat of disease in the cerebrum, contrary to the rule laid down by Andral.

When atrophy is found occupying a considerable extent of the large brain, you will almost always find some atrophy also in the cerebellum, but upon the side opposite to the seat of the change in the cerebrum. In the future you may perhaps be obliged to pay more attention to this fact than has been done in the past. Indeed, much which will be of interest will have to be found in the relation which exists between one-half of the cerebellum and the opposite side of the brain.

PARALYSIS PRODUCED BY DISEASE IN THE CRURA CEREBRI.

I now pass to the consideration of paralysis as it occurs in connection with disease affecting another part of the nervous system. This part, at the base of the brain, for what I have chiefly to say in this course of lectures, is full of interest. It is quite certain that the crus cerebrum upon one side is, according to the generally accepted theory, the only part which establishes a connection between the same side of the brain and the opposite side of the body. As there is no other channel of communication between the spinal cord and brain except through this narrow portion, what pathology there is with reference to this part is by far more important for the admitted views in science than that relating to any other part at the base of the brain. There is no possibility of escape as regards that part. It is a necessity according to the theory so generally and universally admitted that all the fibres which

serve for voluntary movement pass there; all those going from the right side of the brain to the left side of the body are in the right, and those from the left side of the brain to the right side of the body are in the left crus. What are the facts about this? In the first place I will say that, if the theory were correct, when there is disease located upon a small portion of that part of the brain, striking only a limited number of fibres, for instance, the outside fibres, you would always see paralysis limited to certain muscles of the body; to muscles of the arm, of the face, of the legs, one or both, or to the muscles of the arms or legs. But such is not the fact. There are many cases of disease located in one crus cerebrum in which a limited number of fibres were destroyed at the front part, at the back part, upon one side, or within the crus, and in all these instances, if paralysis has been present, it has affected nearly all the muscles, and generally upon the opposite side of the body. There is, therefore, for disease which has destroyed only a small number of fibres, by far more paralysis as regards extent than there should be. This objection is of very great importance. You may find, for there are such cases, that an arm is paralyzed by disease in the crus cerebrum, and the general belief is that the disease is so located as to destroy anterior or middle fibres in such cases. The arm, however, may be paralyzed, whatever the disease may be in the crus, and we generally find that the arm alone is paralyzed when the entire crus cerebri is destroyed upon one side. So there is no connection between the seat of the paralysis or its extent and the situation of the disease in the crus cerebrum, such as there should be if the universally admitted theories were correct.

Still more: there are cases of considerable disease, indeed, according to the statements of some writers, of complete destruction of the crus by abscess; for instance, as in the case of my friend, Prof. Jackson, of Boston, with complete absence of marked paralysis.

Still more: there are cases, recorded by good observers—indeed, four to my own knowledge—in which there was disease in the crus cerebrum upon one side, with paralysis upon the corresponding side of the body. So, with reference to these, as with reference to other parts of the brain, you may find that disease will be present either without producing paralysis, or that it will produce paralysis, both in degree and extent, which it should not; that it will produce paralysis upon either side of the body, when, according to the theory, it should *always* be upon the side of the body opposite to the seat of the disease in the crus.

But more than this: there are many cases upon record—five have occurred to my own knowledge—in which the crus cerebrum on both sides was in a great measure destroyed without producing any marked paralysis. From these last facts you must be led to admit what I have stated a number of times during this course of lectures is true, namely, that a few fibres are amply sufficient to establish communication between the centres of will-power and the muscles.

EFFECT UPON THE THIRD AND UPON THE SIXTH PAIRS OF NERVES.

The symptoms which accompany paralysis, caused by disease in the crura cerebri, are very interesting indeed, and very frequently can show where the disease is. As you well know, a large number of muscles in the eye are moved by the third pair of nerves. Disease in the crus cerebrum affects that nerve almost necessarily, unless the disease is in the back part of the crus, and there will be a certain amount of dilatation of the pupil, showing that there is paralysis of the constrictor fibres of that part of the organ. There will be strabismus, due to the persistent action of the sixth pair of nerves, drawing the eye outwards, and in consequence diplopia. There is besides, paralysis of the muscle which elevates the eyelid, producing ptosis. So, there is ptosis, strabismus, diplopia, and dilatation of the pupil existing in most of these cases. If the disease is in the back part of the crus, the third pair of nerves may escape injury.

It has been considered that the back part of the crura cerebri is the part through which the conductors for sensitive impressions make their way to the brain. That view is radically false, for there are many cases in which there has been destruction of that part without any trace of anæsthesia. There is one case of this kind upon record, in which there was hyperæsthesia instead of anæsthesia.

EFFECT PRODUCED UPON THE OPTIC NERVE.

But there are other features which may lead to diagnosis when disease exists in the crura cerebri, producing paralysis. As you know, fibres pass in this neighborhood which belong to the optic nerve, so that there is very frequently amaurosis, due to disease in the back part of the crus especially, and there may be present what has been described under the name of hemiopia, or loss of sight in one-half of each eye. So, you see, we have the symptoms for making a diagnosis in a number of these cases in which there is disease of the crus upon one side producing paralysis upon the opposite side of the body. Even when there is paralysis upon the same side, diagnosis may be made, although then it would be very difficult in most instances.

EFFECT PRODUCED UPON THE TUBERCULAR QUADRIGEMINA BY DISEASE IN THE CRURA CEREBRI.

When disease exists in the back part of the crura cerebri, there may be injury of the tubercular quadrigemina. These parts have been considered the centre for vision. Certainly they have a great influence upon vision, but disease can exist there without marked amaurosis, or hemiopia, directly. If there is amaurosis, it may exist either upon the corresponding side, or upon the opposite side, or it may exist in both eyes. As a rule, the amaurosis will be upon the opposite side; the hemiopia either in both eyes, or in one eye, but chiefly in the eye upon the opposite side. Unfortunately for the sake of diagnosis, the variety in these symptoms, which may be present in cases of disease of the brain, is extremely great. Still, by a complete analysis of the phenomena observed, diagnosis can be made.

DISORDER OF MOVEMENT.

When the tubercular quadrigemina are involved there will frequently be present a disorder of the movement something like that seen with disease in the cerebellum, although by far less marked. The kind is detected chiefly by asking the patient to close the eyes, when, if due to strabismus or diplopia, you will find that he can stand firmly upon one foot. This is also present with disease in other parts of the brain, but is more marked when the disease is in the tubercular quadrigemina than elsewhere. It is more marked when the disease is at the base of the brain than when in other parts, but most marked when the disease is at the level of the tubercular quadrigemina. It is this which has led physiologists to conclude that the tubercular quadrigemina is the centre for muscular sense. The centre is not there evidently, as we find disease in those parts without producing any lack of

power in balancing the body or in giving direction to its movements.

THE CORPORA STRIATA AND THE OPTIC THALAMI.

We will now pass to the study of other parts of the brain. As you well know, there are two large ganglia, which, part of one, and the whole of the other, protrude into the lateral ventricle of the brain. One, the corpus striatum, is divided into two distinct parts called the intra- and extra-ventricular. Prior to the time of the experiments of Fritsch and Hitzig, the intra-ventricular portion of the corpus striata was considered as the voluntary motor centre. Again, I have to dissent. For, disease in the intra-ventricular corpus striatum, which was believed to be employed in moving muscles, if it produced irritation, would produce convulsions frequently. But there is no part of the brain which has so little power in producing convulsions as the corpus striatum, especially its intra-ventricular portion. This is a decisive fact against admitting that that part is a voluntary motor centre or that it is a centre in connection with others which are admitted to exist in the convolutions of the brain. According to the new views the corpus striatum has not been altogether disposed of. With reference to its function, however, the absence of convulsions when it is irritated by disease is a decisive fact. The facts also with reference to paralysis in connection with disease in the corpus striatum are quite decisive. For there is almost complete, and, in some cases, entire destruction of the corpus striatum without producing a marked paralysis. There is certainly no relation between the extent, degree, and duration of the paralysis and the lesion in the corpus striatum. There are cases in which disease in the corpus striatum has been exceedingly limited in the front part of that organ with complete and persistent paralysis upon the opposite side up to the time of death. The facts, therefore, are quite in opposition instead of being in harmony with the admitted theory regarding the function of this part of the brain. My friend and former assistant, Dr. J. Hughlings-Jackson, holds the view that a small portion of the corpus striatum can perform the function of the entire organ. He knew perfectly well, for he had seen such a case, that if the greater part could be destroyed without producing paralysis, the smaller part could possess the power of the whole, and therefore brought forward the hypothesis. This is a possible thing; but when we find that the entire organ is diseased, without producing paralysis, there is an end to the theory. Still more, we may find disease in both intra-ventricular corpora striata at the same time, without being accompanied by any marked paralysis. This has occurred in more than one case. Although, one case well established would be sufficient, and there are many such cases in which disease more or less complete, has occurred in those two parts at the same time, without producing marked paralysis. The fact that the corpus striatum has no special signs by means of which we can say that paralysis arises from disease in that part of the brain would seem to make the question of diagnosis extremely difficult.

But the diagnosis can be made in this manner.

SYMPTOMS PRODUCED BY HEMORRHAGE INTO THE CORPUS STRIATUM.

In the first place, we will study the effect produced by hemorrhage in that part of the brain, for hemorrhage into the corpus striatum is by far more frequent than hemorrhage in other parts of the brain. There is no part, except, perhaps, the optic thalamus, in which hemorrhage occurs more frequently than into the corpus striatum. There is another exception, yet it can scarcely be called such, and that is hemorrhage between the corpus striatum and the optic thalamus; there are several such cases. The occurrence of miliary aneurism, described by Charcot, is extremely common in the blood-vessels in these two ganglia, and also in the blood-vessels between them, and it is this fact probably which accounts for the frequent occurrence of hemorrhage in those parts. If you have to deal, therefore, with a case of paralysis upon one side of the body with symptoms intimating the occurrence of hemorrhage in the brain, there is a great probability that it has taken place in the corpus striatum, or in its immediate neighborhood. But there are other ways of making a diagnosis; The symptoms previously mentioned and dependent upon paralysis of the third pair of nerves; the existence of amaurosis and disordered movement, the patient showing either a tendency to turn around or to go forward or backward. All these symptoms are by far less frequent, however, when the disease exists in the corpus striatum; vomiting may be present, but occurs less frequently, and also hyperæsthesia, which occurs very frequently with disease in the base of the brain, will be absent in almost every instance of disease in the corpus striatum. So that by passing in review all the symptoms which you know to be very frequent, when disease is in the base of the brain, and knowing that disease in the corpus striatum does not usually produce them, you will be able to arrive at a reasonable conclusion that the disease is in that part. If you add that the patient has had no convulsion, you will have another reason for locating the lesion in the corpus striatum, and this leads me at once to speak of the symptoms accompanying disease in the optic thalamus, for they differ immensely from those which accompany disease in the corpus striatum.

SYMPTOMS OF DISEASE IN THE OPTIC THALAMI.

Disease in the optic thalamus very frequently indeed produces convulsions. The optic thalamus is perfectly able to produce paralysis, and this is an important point against the views so universally admitted by physiologists and physicians. For, the optic thalamus has not been considered by any one as being the seat of the will power for any voluntary movements; and yet hemiplegia, or other kind of paralysis, appears just as frequently from disease in the optic thalamus as from disease in the corpus striatum. We have here again a very clear reason against admitting that paralysis is developed in cases of brain disease because of destruction of nerve-centres in any part of the organ.

The paralysis caused by disease in the optic thalamus has features which are most interesting. There is almost always, in cases of disease in the optic thalamus, change in the reflex faculty. In the paralyzed limbs, or if but slightly paralyzed, reflex irritation disappears or is very much diminished, or just the reverse may be present; that is, considerable increase of reflex movements.

Another important feature is frequent paralysis of blood-vessels upon the opposite side of the body, when there is disease in the optic thalamus. Not that I consider the optic thalamus as the centre for the vaso-motor system, but the fact exists, and is important for diagnosis.

This is the reverse of what you very frequently find in cases of disease of the pons varolii. In disease of the pons varolii very frequently the limbs upon the opposite side of the body are extremely cold, and it

requires considerable destruction of the pons for the reverse to be observed. In disease of the pons varolii, instead of having paralysis of the vaso-motor system, there is excitation and consequent contraction of the blood-vessels and diminution of temperature on the side of the body affected.

The optic thalamus is certainly a most interesting organ to study, and I wish I could dwell at length upon its significance in disease.

But there are other features which are extremely remarkable. The optic thalamus, although it is not the centre for vision, is very frequently, when diseased, the cause of amaurosis Still more, it is very frequently the cause of loss of all the senses upon one side, and almost always, but not always, as there are exceptional cases, the loss of senses is upon the opposite side. The optic thalamus acts much in the same manner as the trigeminus nerve. You know it was shown long ago by Magendie that, when the trigeminus nerve is divided, there is loss of the special senses upon the corresponding side. The action of the thalamus differs from that of the trigeminus, but it resembles it inasmuch as there has been observed alteration of nutrition and change in structure of the eye similar to that caused when there is disease of the trigeminus. This change in structure of the eye has been observed in two cases in which there was disease in the optic thalamus to my knowledge, and probably there are more upon record.

The optic thalamus, or at least a part in that neighborhood, has been considered by many physiologists as the centre for perception or sensation. This is absolutely wrong, and some of the more recent observers have given up that view. I will say, as regards the pretended passage of these fibres conveying sensitive impressions, that those fibres which go from this part to the posterior lobes of the brain, are, almost every day, found destroyed without producing anæsthesia at all. So if these are facts which seem to show that there are fibres, passing through the internal capsule, which serve to convey sensitive impressions, the destruction of those fibres does not produce phenomena which are in harmony with the requirements of the theory.

PARALYSIS PRODUCED BY LESIONS IN THE CENTRUM OVALE.

I now pass to other parts of the brain, and let us first study the effects produced by lesions in the radiating white fibres which go to make up the centrum ovale, or the white matter of the cerebral lobes. Those parts can produce paralysis, and the paralysis produced by lesion there can be just as great as paralysis produced by lesion in any other part of the brain. A lesion occupying the most distant parts of the brain, either in the posterior, the middle, or the anterior lobes, can produce paralysis. There is in that fact evidence quite clear and quite abundant against the view which I am fighting. We find that disease in any part of the centrum ovale can produce complete paralysis upon the opposite side of the body. If that alteration is limited in the posterior, the middle, or the anterior lobe, how can it be that all the voluntary motor fibres are destroyed in such a limited part of the brain? This certainly cannot be admitted. When the disease is located only in a small part of the white matter of the brain, we cannot reconcile the fact which follows with the requirements of the theory. There should be only a simple localized paralysis—a slight degree of paralysis; but, on the contrary, we find that complete hemiplegia occurs, which is persistent from disease in those parts. The reverse also is found, and an entire, or almost entire, hemisphere has been destroyed without producing any marked paralysis. In collecting facts we have found a series which show that either paralysis or convulsions may exist either upon the corresponding side or upon the opposite side. The paralysis exists almost always upon the opposite side; in some cases, perhaps one out of three hundred, it will be found upon the same side. Not so, however, with convulsions, for when the white substance of the brain is diseased you will find them upon the corresponding almost as frequently as upon the opposite side. It is due to irritation only that such convulsions are present.

THE TREATMENT OF FRACTURE OF THE SHAFT OF THE HUMERUS.

CLINICAL LECTURE DELIVERED IN BELLEVUE HOSPITAL,

BY FRANK HASTINGS HAMILTON, M.D.

(Reported for THE MEDICAL RECORD.)

GENTLEMEN:—I will occupy a portion of the hour to-day in discussing the subject of fracture of the shaft of the humerus. Please remember that I confine my remarks to fracture of the shaft of the bone, the same as when speaking of fracture of the shaft of the femur, and make no allusion whatever to fracture near to or involving either the upper or the lower extremities of the bone. It is in the humerus, more frequently than elsewhere, that we find ununited fracture. Next in point of frequency, ununited fracture occurs in the femur. The position of this bone is quite analogous to that of the femur; that is, it is the upper bone of the upper extremity, and it stands alone, having no other bone attached to it, as does also the femur in the lower extremity. The positions of these two bones, then, are in many respects alike, but there are important points of difference.

TO OVERCOME THE SHORTENING.

In case of fracture of the shaft of the femur, the greatest difficulty in the way of treatment is to overcome the tendency to shortening.

There are two reasons why, in case of fracture of the shaft of the femur, this tendency should be the first object of attention, while, in case of fracture of the shaft of the humerus, it may be considered as secondary. First, the femur is one of the main bones of the extremity upon which we walk, and any considerable shortening will cause a halt in the gait. In case of fracture of the humerus, the shortening that occurs with ordinary treatment is of no importance, because unless revealed by careful measurement, the patient will know nothing about it.

In the second place, in case of fracture of the femur we have a muscular force to deal with which is immensely more powerful than that which is brought into action in case of fracture of the humerus, hence the tendency to shortening is so much the greater in the former case. Indeed, I may say at once, that this indication in the treatment of fracture of the humerus, namely to prevent shortening, is unimportant. The patient will not recognize it, if it occurs, and I am not quite sure but that the bone unites a little more completely and certainly because of the fact that the fragments do overlap. Nevertheless, surgeons have endeavored for a long time to devise some dressing which should overcome such tendency.

(Several splints were exhibited, but their inefficiency was demonstrated by pointing out the fact that they could not have sufficient purchase upon or attachment to the arm to make adequate extension and counter-extension.)

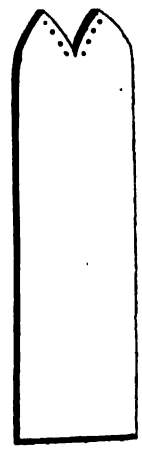
My friend and colleague, Dr. Stephen Smith, has lately treated a case in this hospital by continued extension, which I was permitted to see in the course of the treatment. I brought the patient before you at the last clinic, and we found the arm united, straight, and lengthened about half an inch. I think the lengthening was due to the relaxation and stretching of the ligaments about the shoulder-joint. The case was exceptional and the treatment was exceptional. It was a compound fracture of the shaft of the humerus, and no lateral supports could be applied. So the doctor laid him on his back in bed, his arm resting on a pillow, and with adhesive strips, a cord and pulley, supported by an upright fixed to the side of the bed, extension was made, the counter-extension being the weight of the body. You see, however, that this rendered it necessary that the patient should remain on his back, in bed, for several weeks, a method of treating a fracture of the humerus which no one would submit to for the purpose of preventing a little shortening.

Dr. Clark, of St. Louis, has devised another method of keeping up extension, and it is to suspend a weight from the lower portion of the humerus, while the patient maintains the sitting or standing position. Only a very moderate weight is required to keep up the amount of extension requisite to overcome the tendency to shortening. But you can easily understand that this apparel does not permit the patient to lie down, while the apparel employed by Dr. Smith does not permit him to get up. Practically, therefore, these methods of making extension here have very limited application, but inasmuch as extension and counter-extension are not necessary, the shortening which follows this fracture having no practical importance, it is not necessary to resort to any device for the purpose of overcoming that tendency.

TO MAINTAIN THE FRAGMENTS AT REST AND IN LINE.

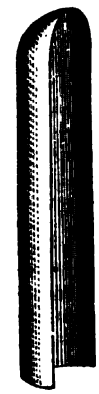
I have next to call your attention to what, in the case of this bone, I consider the most important indication of treatment, namely, to keep the fragments quiet and in line. I speak of the means for keeping the fragments *quiet;* first, because this is the bone which more frequently remains ununited than any other in the body. A certain kind and amount of motion is not incompatible with prompt union, but a *to and fro* movement between the fragments *seldom* or *never fails to prevent union.* The difficulty in this form of fracture is that there is a tendency to the production of this kind of motion; and this tendency is not restrained by the ordinary, and what has been regarded as the best, method of treatment. When the forearm is placed at a right angle with the arm and some form—an angular splint, for example—of retentive apparatus employed to secure immobility at the elbow-joint, the elbow-joint will soon become more or less anchylosed; but in spite of the splint, the patient will give more or less of motion to the hand and forearm every time he lies down and gets up, for he is constantly supporting the hand sometimes higher, sometimes lower, and all these slight movements do not terminate at the elbow-joint, but are transmitted through it to the upper end of the lower fragment, causing at this point a to and fro movement. It places the arm and forearm in an awkward position to dress them on a long, straight splint, and then permitting the whole arm to hang beside the body, and I do not advise it, because I think you can secure the requisite immobility of the fragments in a much easier manner. I have never seen a case in which the fracture has failed to unite when dressed in the manner which I am about to describe. A splint is constructed which reaches from above the top of the shoulder down to, but not overlapping, the condyles of the humerus. This splint may be made of leather, gutta-percha, felt, etc. It is made cup-shaped at the top so as to cover the point of the shoulder, simply for the purpose of preventing it from sliding down. The splint should be moderately padded with cotton, and then covered with cloth. The main object of the covering is to furnish something to which the bandages can be fastened by the aid of a needle and thread. No other splint is necessary absolutely, but I use a short splint, well padded and covered, and placed upon the inner surface of the arm simply to keep the bandages from cutting into the axilla and delicate skin on the under side of the arm. The top of the long splint rests against and over the head of the humerus; it is bound about the limb by successive turns of a roller-bandage, and is the essential splint; the short splint is applied simply for the purpose mentioned, and the dressing is complete.

FIG. 1.



Pattern of Long Splint, *from Hamilton's Treatise on Surgery.*

FIG. 2.



Same complete.

But you may ask why do you omit to bandage the forearm? First, because it is useless. Second, it is almost impossible to apply a bandage so equably as not to obstruct the circulation at some point, and especially about the elbow-joint. With the bandage on, if the arm is a little straighter, it is loose, if it is a little more flexed, it is tight. Third, it is exceedingly liable to get disarranged, and prove a source of annoyance rather than of comfort to the patient. Having omitted it, I have found that the limb does not swell if the bandages about the arm are not applied too tight. If the hand and forearm are inclined to become swollen, the patient can lie down for a few hours. Practically, I have no difficulty whatever in omitting the bandage for the hand and forearm. I omit the angular splint. Because the splint increases the stiffness of the joint, and I desire that the patient shall move the joint, not violently, but that he may feel at liberty to move the joint and lift the hand as he chooses. But can we keep the fragments in place if we omit the angular splint? I can simply give you the result of my experience. During the past fifteen years I have not used any dressing for the forearm while treating a fracture of the humerus, and, as already stated, I have not in a single instance failed to secure prompt union. The main reason why I leave

the elbow-joint free is to prevent non-union. The moment the elbow-joint becomes stiff, no matter how produced, movement will occur at the seat of fracture; the upper end of the lower fragment receives the motion transmitted to it from the forearm and hand through the stiffened elbow-joint. I have seen many cases in which non-union of this bone has taken place where the angular elbow-splints were employed, but none in which the method I have now described was employed. I have also reported three cases in which union being greatly delayed, it has been speedily brought about by putting the whole arm and forearm in a straight splint, and permitting it to hang beside the body, in the manner described in my Treatise on Fractures and Dislocations. Do not omit to cover both splints with cloth, for this simple apparel will be sure to be displaced unless the bandages and the splints are firmly stitched to each other. The bandage need not be carried higher than the margin of the axilla, because above that point it is impossible for it to get any hold upon the upper fragment; the splint, however, gets hold of the fragment, unless the fracture is at the surgical neck or higher. It is thought by some to be necessary to carry the bandage over the shoulder and through the axilla upon the opposite side; this looks very well, but it possesses no value whatever.

I have omitted to say that, having secured the splints in place, bring the arm against the side of the body, and secure it to the body with two or three turns of a roller-bandage, carried horizontally around the arm and body. This should also be stitched to the splint. Let there be no pressure of the bandage in the axilla or at the bend of the elbow. The hand is then placed in a sling, but the patient is at liberty to take it out, and move the elbow whenever he chooses. From day to day the splints must be examined, and if the arm shrinks, and they become loose, it is not necessary to open the dressings and renew them, but they can be tightened by overstitching, taking in a fold of the bandage. This must be attended to faithfully. And again I repeat, if it swells below the elbow, as it may do in exceptional cases, let the patient lie down.

(Two patients were then shown with fracture of the shafts of the humerus dressed in the manner above described.)

Dr. Hamilton concluded by saying that fractures through and above the surgical neck, and in the neighborhood of the elbow-joint, would be considered at another time. The latter of these generally demanded the use of an angular splint.

A case was then shown of dislocation of the shoulder-joint, but in which a suspicion was entertained that it was complicated with a fracture. Treatment was reserved. The clinic was then closed with an operation for hare-lip.

Leipsic.—Dr. Ernst Wagner has been chosen to succeed Wunderlich in the University of Leipsic. He has been relieved from his previous duties and made Professor of Special Pathology and Therapeutics, and Director of the Medical Clinic.

Conviction of a Quack in the Benange.—Charlatanry in the Gironde has received a cruel blow in the person of one of its most powerful high-priests. In spite of a life of devotion to empiricism, in spite of numerous attestations and certificates, the Sieur Bissière, the "good genius" of the Benange, was condemned to six months' imprisonment and a fine of 1,000 francs. The conviction was largely due to the efforts of the *Comité de Défense Professionelle*.

Reports of Hospitals.

NEW YORK HOSPITAL.

Notes of Practice and Peculiarities of Treatment.

The following cases were recently noted in the service of Dr. H. B. Sands, Attending Surgeon:

COLLES' FRACTURE OF THE RADIUS.

The patient, a man of 24, slipped on a banana-skin and fell, striking on the palm of the hand. The deformity was easily reduced, and an antero-posterior splint was applied. Later, the Morris treatment was adopted. Two bandages, three inches in width and rather loosely rolled, were placed on either surface of the forearm, over the seat of fracture, and maintained in place by a broad strip of adhesive plaster, making sufficient compression to keep the fragments in position. The result was satisfactory.

FRACTURE OF PATELLA.

The injury was the result of muscular contraction, in the effort of the patient (aged 42) to save himself from falling on being roughly assaulted in the street. The fracture was transverse, and was accompanied by a good deal of swelling. At first, a posterior splint was applied, and a lotion of muriate of ammonia with equal parts of water and alcohol ordered, and it was found that the separation of the fragments was not so great as at first, being now less than ¼ inch. Tilford's strap-and-buckle apparatus was then applied, and the limb placed on a high inclined plane. After that the strap was tightened little by little until the separation was hardly perceptible, and at the end of a month a posterior plaster splint was applied. In three weeks more the patient was allowed to get up, and shortly after that the splint was removed. In two months from the time of admission the strap-and-buckle apparatus was also removed and an elastic knee-cap applied, and two days afterwards he was discharged cured. A second case was also treated with equal success in the same manner.

MULTIPLE FRACTURE OF TIBIA.

The patient was a sailor, and the injury was caused by his being thrown violently down among some chains by a heavy wave which swept over the deck. He also sustained a dislocation of the humerus. The leg was found to have been fractured in two places, the middle third being separated. The deformity was very noticeable, and all attempts at reduction proved futile. It was treated by means of the fracture-box, and there was an inch and a half shortening. The common treatment for fractures of the tibia and fibula was noted to be the fracture-box, afterwards followed by the plaster-of-paris bandage, and excellent results were commonly obtained.

FRACTURES OF THE FEMUR

were treated either with the plaster-of-paris splint or with Buck's extension apparatus, with Volkmann's sliding contrivance for keeping the foot straight, and ordinarily a long external splint. One case, in which a plaster-of-paris bandage was employed, left the hospital doing well while still wearing the splint.

FRACTURE OF HUMERUS—FRACTURE OF RIBS—RUPTURE OF SPLEEN.

The patient, a female of 33, fell from the paint platform of the Olympic Theatre to the stage below, a distance of over thirty feet. On admission she was in great agony, suffering from pain in the arm and all the way down the left side, with difficult respiration. Examination revealed fracture of the left humerus in its upper third, but, owing to the patient's condition, the examination was not very thorough. The arm was simply put up in a coaptation splint and kept quiet. The pain in the side and interrupted breathing were easily accounted for by a fracture of the lower five or six ribs, some of them being apparently broken in several places. Broad straps of adhesive plaster were tightly drawn around the chest, and great relief was thus afforded. Owing to the suffering of the patient, the examination of the pelvis was necessarily incomplete, but the point of greatest pain seemed to be over the tuberosity of the left ischium. Motion at the hip-joint was unimpaired, though somewhat painful. During the night 75 minims of Magendie's solution were administered hypodermically without affording much relief, and brandy was given both by the mouth and rectum. She vomited at frequent intervals, and her condition was at times very critical. On the day following she was considerably more comfortable and in better condition generally, but one day later symptoms of peritonitis showed themselves, and four days from the time of admission she died. The autopsy revealed a comminuted fracture of the upper third of the left humerus and fractures of five ribs on the left side, one or two of them in two places. There was hypostatic congestion of the lower lobes of both lungs and a rupture of the spleen, with effusion of blood into the peritoneal cavity. There were no signs of peritonitis, but well-marked evidences of chronic parenchymatous nephritis.

COMPOUND FRACTURE OF TIBIA AND FIBULA—LISTER'S DRESSING—DEATH.

The patient was injured by a fall from his wagon, together with a kick from the horse at the same time. On admission there was diagnosed a compound comminuted fracture of the right tibia in its upper third and a simple fracture of the fibula, with an opening about half an inch in diameter leading down to the bone. The hemorrhage was very free. Three hours after the receipt of the injury the limb was put up in Lister's dressing, the wound, having been previously injected with a solution of carbolic acid of the strength of one part to twenty. After that the dressing was changed about every three days. The leg continued very much swollen and œdematous, but there was no elevation of temperature. On the 16th day it was noticed that there was a great deal of redness around the wound, when the dressing was again changed. The next day the swelling continued undiminished, and the redness had extended up to the thigh. The dressing was again removed. On the 18th day the spray was discontinued, the antiseptic treatment in all its details being no longer thought applicable. Six days afterwards, the injury having done badly, the Lister dressing was abandoned entirely, and the leg hung in a sling while poultices were applied. At this time there were noticed cough and rusty expectoration, and on examination it was found that there was dulness on percussion, with bronchial breathing on the right side of the chest. Shortly afterwards a typhoid condition was developed, and the patient died one month and two days after the accident.

HYDROCELE—OPERATION FOR RADICAL CURE.

Twelve months previous to admission the patient (aged 20) noticed a gradual enlargement of the scrotum on the left side, proceeding from below upward, painless, and unattended with any constitutional disturbance. It increased slowly, but never attained any great size. The inguinal canal was found to be empty, and the cord, with the elements thereof, distinct. There was fluctuation, translucency, and dulness on percussion. The tumor being tightly grasped above by the left hand, a small incision was made in the integument, and a trocar and canula plunged in. About four ounces of clear, amber-colored fluid were evacuated, which showed an abundant deposit of albumen under the ordinary tests. One drachm of undiluted tincture of iodine was then injected, the injection being followed by very severe pain for about an hour, when it gradually subsided. Within ten days the patient was discharged convalescent.

RECURRING SARCOMA IN STUMP AFTER AMPUTATION OF LEG—REMOVAL.

The amputation, in the middle third of the leg, was performed by Dr. Sands in January last at the Roosevelt Hospital, for malignant disease, which had existed for seven years previously. The stump healed in six weeks, and the patient, a female of 48, remained perfectly well for nine months. About four weeks before admission she felt a sharp pain in the stump, and on examining it she discovered a small nodule similar in character to the one that preceded the former growth. At the time of admission her general health was excellent and her appetite good. Situated in the dependent part of the stump was found a tumor, which was hard, distinctly circumscribed, about one and a half inches in diameter, and not painful or sensitive to the touch. The skin moved freely over it. An incision was made in the line of the old cicatrix and the tumor dissected out. There was very little hemorrhage, and the edges of the wound were brought together with catgut sutures. It was dressed with a layer of gauze and borated cotton, covered with gutta-percha tissue, held in position by a bandage. In two weeks the patient was discharged cured, there having been no elevation of temperature at any time.

THROMBOSIS OF VULVA.

The patient, while engaged in washing, slipped and fell over the wash-tub, causing a severe contusion of the vulva. Swelling began immediately, and on the following day a severe hemorrhage took place. She did not apply for treatment until five days after the injury, and in the meanwhile had lost a great deal of blood. On admission the vulva was found to be œdematous and greatly swollen, and there was a large lacerated wound on the left side, about three inches in length, and filled with clotted blood. The clots were turned out and the wound dressed with salicylized jute, after which the patient made a good recovery.

CHANCROID.

The following treatment has been found serviceable in a considerable number of cases. First, salicylic acid in powder is sprinkled over the sore, and then the following wash is applied:

℞. Acid salicylic,
Sodii borat..... ää gr. xv.
Glycerinæ..... fl. ʒj.
M.

In one case, in a female, the chancroid was touched with nitrate of silver and then dressed with black wash.

EXTENSIVE SUPERFICIAL BURNS.

The burns were the result of an explosion of gas escaping from a city main, and involved both hands and forearms to the elbow, and the back of the neck and forehead. On admission the patient was suffering intensely, and thirty minims of Magendie's solution of morphia were hypodermically injected before any relief was afforded. The following treatment was employed. To the hands and arms vaseline, combined with oxide of zinc and a few grains of salicylic acid, was applied, and to the face and neck vaseline alone. When the sloughs began to separate, they were dressed with salicylized jute, a layer of gauze being interposed between it and the burned surface. On two of the fingers of each hand the burns were quite deep, and on the posterior surface of the ring-finger of the right hand the joint was exposed, so that splints had to be used for both hands. The result was satisfactory.

SARCOMA OF TESTICLE—HYDROCELE—CASTRATION.

Fifteen months before admission, the patient, a music-teacher aged 48, noticed that the left testicle had become hard and enlarged, and six months afterwards the enlargement seemed suddenly to increase and to become soft and fluctuating. He applied for treatment and was put upon iodide of potassium, the tumor itself being painted with tincture of iodine, which caused it to shrink in size and become hard once more. This shrinkage was only temporary, however, and the testis soon began to increase steadily again, the growth being from below upward. At the time of admission his general health was excellent, and he had six children, all of whom were in good health. His parents were scrofulous, and two sisters died of cancer. He had never had syphilis. The tumor was found to completely involve the left side of the scrotum, extending up on the abdomen for a short distance. It was hard below, and somewhat less resisting above. It was dull on percussion (which caused the patient pain), did not transmit light, and gave no impulse on coughing. It was rather egg-shaped in appearance, and its long diameter was 6¼ inches, while its circumference was 9¼ inches. The spermatic cord could not be felt.

By means of the aspirator (the needle being inserted at the upper part of the tumor), nearly three ounces of clear amber-colored fluid was withdrawn, which became solidified on the application of heat and nitric acid. After the aspiration, the vertical diameter of the tumor was 5¼ inches and its circumference 7¼ inches, while the cord could now be distinctly felt, and was found to be normal. Two days afterwards (during which the sac had filled to its former size) an incision about five inches in length was made, extending downward throughout the length of the tumor and cutting through the dartos and tunica vaginalis, which of course emptied it of fluid. The testicle was then enucleated, and the cord having been seized high up with a clamp, was divided at a point where the tissue was healthy. Four or five arteries were tied with catgut ligatures, which were cut off short and allowed to remain in the wound, while catgut sutures were used to close it. The dressing was borated cotton, a layer of gauze being placed between it and the wound. The patient did well, and was discharged cured at the end of a month. The tumor was found to be a soft sarcoma, implicating the entire testis and containing a cyst in its centre.

STRICTURE OF URETHRA—URETHROTOMY.

The patient had twice suffered from complete retention of urine. On the introduction of a bulbous instrument two strictures were detected, one just behind the meatus, admitting a No. 11 bulb (English); the second, 2¼ inches from the meatus, admitting a No. 13 (English). The stricture behind the meatus was cut with a bistoury, and the deeper one with Otis's instrument. After the division the urethra admitted a No. 17 (English) sound. The patient made a good recovery, being discharged cured at the end of a month.

PERITYPHLITIS—RECOVERY.

Two and a half years before the patient had an attack of illness, which lasted six weeks, and for which he was treated at the Roosevelt Hospital. From the symptoms described it was probably perityphlitis. After that he remained perfectly well up to ten days before admission. He then noticed pain, tenderness, and swelling in the right inguinal region, where the same trouble had made its appearance in his former attack. The symptoms continued to increase in severity until he came into the hospital, when it was found that the pain was continuous, and for the most part dull in character, though at times sharp and lancinating. He had had no movement of the bowels since the onset of the affection, though three days previously he had taken a large dose of Epsom salts. He had vomited on each of the two days preceding his admission, but did not vomit on that day. There was dulness on percussion in the right inguinal region. He was ordered a dose of castor-oil, which produced a slight movement of the bowels. For five days afterwards he continued to have the same tenderness and pain in the inguinal region, with obstinate constipation and elevation of temperature, at the end of which time suppuration was detected low down in the abdomen, near the median line. The patient was etherized, and an incision about two inches in length made parallel with Poupart's ligament. The discharge of pus was very great, and the finger being inserted into the cavity of the abscess, it was found to extend upward and outward in the direction of the caput coli. The pus was extremely offensive in odor, but contained apparently no fæcal matter. The temperature at once fell to the normal standard, and the patient made a prompt recovery; the only drawback being a difficulty in passing urine, which continued for a few days.

RECURRENT NASO-PHARYNGEAL POLYPUS.

The growth began four years ago, and two years since the superior maxilla of the right side was exsected and the tumor removed. It grew again, however, and in the May following a second operation was performed. Last January it was removed for the third time, and in March, Dr. Sands, under whose treatment the case had been from the beginning, noticed still another recurrence of it, and from May to August it was treated by means of electrolysis. On admission it was found that the growth did not interfere with deglutition or respiration, and that it caused only a slight thickness of speech. The man had worn an artificial jaw since the removal of the bone, which concealed all deformity of the face in a very satisfactory manner. The patient having been etherized and a gag inserted, the stump was touched in every part with Paquelin's benzine cautery; and two days afterwards he was discharged.

CANCER OF THE CHEEK—OPERATION.

Six or seven weeks before admission, the patient, a man of thirty-nine, noticed a slight soreness and smarting on the buccal surface of the left cheek, and then felt a small prominence, which gradually increased in size afterwards. It gave him very little an-

noyance, however, unless acrid fluids came in contact with it. His family history was good, and his general health excellent. When he came into the hospital there was found a small, hard, elevated tumor on the inside of the left cheek, and a considerable enlargement of one of the glands of the neck near the angle of the jaw. An incision two inches long was made from the angle of the jaw downward and forward, dividing the fibres of the platysma myoides transversely, and the enlarged gland was found somewhat adherent to the surrounding tissues, so that it could not be enucleated without considerable cutting. One artery and one vein were tied. The lips were then grasped to control the coronary artery, and an incision was made through the cheek from the left angle of the mouth almost to the anterior border of the masseter muscle, when the coronary artery was ligated, and the second molar tooth of the lower jaw extracted. The tumor was completely excised, and a growth implicating the neighboring gum removed with a bone-scraper. A number of arteries had to be tied, and other bleeding points were touched with the actual cautery. The principal wound was closed with hare-lip pins and twisted sutures, while the wound in the neck was left partly open and dressed with gauze and absorbing cotton. Three days afterward the hare-lip pins were removed, and firm union was found. The cavity in the neck was dressed with picked lint saturated with carbolized oil, over which the absorbing cotton was placed. At no time after the operation did the temperature exceed 101⅘°, and the result was very satisfactory.

GANGRENE OF THE FOOT—SYME'S AMPUTATION UNDER CARBOLIZED SPRAY—LISTER'S DRESSING SUBSEQUENTLY.

The patient was a child of five years, who was injured by having a street car pass over his foot. On examination it was found that there was compound fracture of the metatarsal bones of the right foot and severe contusion of the left. The tissues looked black and soggy, and gave evidence of very little vitality, while the odor was putrid. The boy was very restless, and the temperature 101⅘°. A consultation was held, at which it was decided not to operate. The wound was dressed with carbolized oil, and small doses of opium were given to alleviate pain. In four days the slough on the right foot had separated, involving half the foot. The tissues of the left foot presented a dark and sloughy aspect. Five days afterward an abscess of large size showed itself on the inner side of the left ankle, and the tissues of that foot, though not gangrenous, did not present any reparative changes. Two weeks after admission Syme's amputation was performed on the right foot under the carbolized spray. Five vessels were tied with catgut ligatures, a drainage-tube inserted, and the flaps secured with silver sutures; after which Lister's dressing was applied. The abscess on the left foot was then opened under the antiseptic spray. There was a considerable discharge of pus, but when the finger was inserted into the cavity, it was found to be superficial. It was injected with a solution of carbolic acid (one part to twenty), dressed after Lister's method, and the protective net employed. In ten days the flap had sloughed away, leaving the bone exposed. On either side was seen a line of new granulation tissue. A wet-dressing was then applied, the Lister being discontinued. The next day a strap-and-extension apparatus was applied in order to bring the edges of healthy skin near each other, and so cover the bone. The case is still under treatment.

PUNCTURED WOUND OF PERINEUM—RUPTURE OF URETHRA—PERFORATION OF RECTUM.

The patient, a boy of thirteen, while attempting to balance himself on one foot on the top of a fence, slipped and fell astride of it, impaling himself upon an iron spike. On examination, it was found that there were two lacerated wounds in the perineum, one immediately in front of the anus, extending upward for a distance of two or three inches and perforating the gut, and involving the other near the scrotum and rupturing the urethra. The hemorrhage, which was very profuse, was controlled by pressure. The urine passed first through the perineal opening; but two days at afterwards there being retention, the patient was etherized, and while this was being done he passed a large quantity of water in the bed. He was then placed in the lithotomy position and attempts made to introduce a catheter, but without success. The two wounds were made into one by an incision through an intervening band of skin, and it was probed with the hope of finding the proximal end of the urethra. This also proving unsuccessful, a catheter was again introduced through the meatus, and this time it fortunately entered the proximal end of the urethra in the wound and then passed into the bladder. Finally the catheter was tied in position. The case is still under treatment, but at last accounts was progressing very favorably.

In another case very similar to this, in which impassable stricture followed the accident, Dr. Sands performed perineal section without a guide, and the case terminated successfully.

DEATH OF A NUN FROM HYDROPHOBIA.—A sister of the *Ordre de Troyes*, who had been engaged in the care of the sick, died in Paris last October, of an attack of hydrophobia. The disease had been contracted under circumstances so peculiar that they deserve mention here. About a month before her death, she was walking in the country with a party of five small children, the oldest of whom was only eight years of age, when the party was suddenly attacked by a large sheep-dog. The sister immediately threw herself between the frightened children and the dog, and was badly bitten. The maddened animal, excited by the cries of the children, then made a rush at them, but was again intercepted by the brave sister. The devoted woman threw herself upon the animal and held on to him for over ten minutes, rolling over and over on the ground with him, and endeavoring to strangle him and to thrust her hand into his throat. Finally, some peasants came to her rescue and killed the dog. When the sister's wounds were examined, fifteen deep lacerations were found on her hands and arms. These were at once cauterized with ammonia, and one large artery which had been opened was ligated. Two hours later she was seen by a physician, who cauterized the wounds anew with a hot iron. As soon as the condition of her wounds permitted, the patient was removed to Paris. For some time hopes were entertained of her recovery, but, three weeks after the wounds were received, symptoms of hydrophobia set in, to which she succumbed six days later. During her sickness her conduct was marked by the same courage and devoted self-abnegation that characterized it on the occasion of her conflict with the mad dog. It is difficult to find words to express the admiration that every man must feel for heroism like this. The noble act of the obscure sister is a title of imperishable glory, not only for herself, but also for the order of which she was a member, and for her entire sex.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, February 2, 1878.

INSANE ASYLUM MANAGEMENT IN THE STATE OF NEW YORK.

In the course of a somewhat extended review of Dr. Bucknill's "Notes on Asylums for the Insane in America," the editor of the *Journal of Nervous and Mental Diseases*, Dr. J. S. Jewell, animadverts with a deal of directness and severity upon the extravagance of asylum management in this State, and makes sundry statements, as to the expenses of the New York State Lunatic Asylum at Utica, which are very damaging to the reputation of one of our most distinguished experts, unless, as must be presumed, the latter gentleman can satisfactorily explain them. It happens that the attention of Dr. Bucknill was called to the cost of support at Utica—one of the institutions he was careful to visit while here—which he states at $4.50 per week, and in striking contrast with an average a fraction less than $2.50 in British institutions of the same grade. The eminent English alienist attempts to account for the difference between the weekly cost of maintenance at Utica, $4.50, and that of the New York City Asylum, $1.30 per week. His impression from a visit to the latter was that the patients were badly clad and insufficiently fed; but in the end he frankly confesses that the extraordinary disparity cannot be more than partially due to that fact. The general weekly average at American asylums Dr. Bucknill puts at $4.00, which is near enough for practical purposes. Dr. Conrad, of the Maryland Hospital for the Insane, in his admirable pamphlet on the "Financial Relations of Insanity," has collated the statistics of 58 State hospitals, with exact and reliable results as to maintenance expenses; and from a summary of his figures it appears that the number of patients under State hospital treatment at the beginning of the year 1876 was 26,433, at a total annual cost for the 58 hospitals of $4,803,748. The average in each asylum was 440 for he year 1875, and the average annual cost of maintaining each patient was $182—exactly $3.50 per week. Another collection of hospital statistics in our possession gives the annual per capita cost for 1876, in 16 asylums, as follows:

Connecticut Asylum for the Insane.....	$291.00
Minnesota Hospital for the Insane.....	185.80
North Carolina Insane Asylum.....	286.00
Taunton Lunatic Asylum.....	104.81
Toronto Asylum for the Insane.....	133.51
Maine Insane Hospital.....	241.00
Eastern Lunatic Asylum, Virginia.....	196.75
Western Pennsylvania Hospital.....	241.00
Vermont Asylum for the Insane.....	189.00
Tennessee Asylum.....	190.67
State Lunatic Asylum, Harrisburgh....	254.00
Northampton, Mass.. Asylum.....	192.55
New Jersey Asylum for the Insane.....	304.49
Indiana Hospital for the Insane.....	233.50
Athens, Ohio, Hospital for the Insane..	184.00
Wisconsin Asylum for the Insane.....	291.00
Yearly average.....	$225.57
Weekly average.....	$4.34

Dr. Conrad finds the yearly average in 53 first-class State and corporate asylums, adduced in concluding his pamphlet, to be $206.49, or $3.97 per week; while Dr. Callender, from a collation of 20 asylums in different sections of the United States, deduces an average of $230.50 a year, or $4.43 per week. The last is doubtless an excessive estimate.

Dr. Jewell has been at the pains to collate the facts and figures of the reports of Dr. Gray, of the asylum at Utica, from 1869 to 1876 inclusive. During this period it appears that, for the maintenance of a daily average of 600 patients, an average yearly amount of $173,260 has been expended. This represents a rate of $5.55 a week for each patient, which is 57 per cent. in excess of Dr. Conrad's statistics for 58 asylums, 40 per cent. over Dr. Conrad's average for 53 asylums, and 25 per cent. above Dr. Callender's extremely liberal average. Taking the statement of Dr. Jewell, that the average weekly cost in American asylums of the first class is $4.00, the Utica reports show an excess of $48,360 a year for eight years in the maintenance account of the superintendent, in addition to which he has received an average sum of $37,850 per year for repairs and improvements, while the capacity of the asylum has not actually been increased in the least during the eight years under review. Putting these two items together, Dr. Gray's total yearly excess since 1869 has averaged the enormous amount of $86,210; and during the last eight years the institution managed by him has cost the State of New York $689,680 in excess of what might have been expected, comparing it with the expenditures of other asylums. As this city has to pay one-half the extraordinary and a part of the ordinary

expenses of the State asylums, in addition to supporting one of her own, the management of the institution is consequently one of very immediate interest to our already overburdened taxpayers. These, it should be understood, are Dr. Jewell's figures, not our own, although they are carefully verified by the reports to which he refers.

That there should be a considerable discrepancy between weekly averages of the New York City Asylum and the Utica would naturally follow, for, while the former receives pauper patients only, the latter admits private and paying ones, in addition to those received from the various counties. But it will be admitted, as Dr. Bucknill very mildly observes, that a difference of 250 per cent. is rather too extreme to be passed over without inquiry by the public, or without such an explanation by the superintendent as a careful examination of his reports fails to afford. For, on investigation, it appears that Dr. Bucknill was not any more correctly informed, when he stated the weekly average at Utica at $4.50, than when he stated the general average at $4.00. On the contrary, a collation of the reports of the asylum for the last eleven years, 1866 to 1876, including both, shows that the real weekly average, as based upon receipts from counties, from pay patients, and upon salaries and clothing, is 25 per cent. greater than stated by Dr. Bucknill, and about the same as stated by Dr. Jewell upon collation of the reports from 1869 to 1876. As the table is interesting, altogether exclusive of its bearing upon the justice of Dr. Jewell's strictures, our readers will no doubt be glad to have it in a form for easy reference when necessary.

	Patients.	Weekly Cost of Board.
1866	643	$4.85
1867	610	4.77
1868	590	5.34
1869	600	4.86
1870	630	4.92
1871	605	5.04
1872	588	5.16
1873	563	5.11
1874	581	5.56
1875	595	5.90
1876	615	5.92

For the last ten years, by way of contrast to this, at the Northampton Asylum, Mass., the average number of patients has been 430, at an average price received for each patient per week of $3.78. Indeed, from the statements of the report of the asylum for 1877, pages 22 and 23, it appears that the institution receives only $3.50 per week for town patients, exclusive of clothing. For private patients the income varies, but the average of all of this class who were in the house at the end of the fiscal year 1877, was $5.13, which covered all necessary expenses, exclusive of clothing and damages. The average weekly pay per capita which the hospital received last year for patients of all classes, was $3.70.7—that is to say, a minute fraction less than $3.71, which, it will be observed, is a fraction less than the average as calculated upon the reports of the last ten years. Such is the exhibit of the Northampton Asylum as compared with the Utica hospital. And yet the former has accumulated, as profits for ten years, $154,127.19, invested in real estate, repairs, improvements, and supplies on hand —a difference very difficult to explain when one considers that coal is nearly twice as expensive at Northampton as at Utica, flour averaging at least one dollar a barrel more, and all provisions, supplies, and labor being somewhat higher. How, then, is it that the one makes money at $3.78 per week, and the other is constantly calling for deficiency appropriations—$310,941.74 for the last ten years—at a weekly average of $5.50 per patient? The average deducible from the preceding figures is, it should be stated, exclusive of clothing, which ought of course to be set down to the account of maintenance, although Dr. Gray usually reports it under the head of extraordinary expenditures. For the year 1871, for instance, he transfers $16,143.42 for clothing, $19,705.74 for ordinary repairs, and $11,380.47 for farm work, to the column of extraordinary expenditures, thus obtaining a factitious weekly average of only $4.96.

Dr. Jewell's criticism is to the point here; and since he is an expert in these matters, his strictures are worth quoting:

"In 1874," says Jewell, "he (Dr. Gray) properly reports the sums for ordinary repairs ($30,420.87), and for farm expenses ($10,250.68), as ordinary expenses, in this way reducing the sum of his extraordinary expenditures to a less immoderate amount ($16,743.13), and making a few thousands more or less in the gross sum of his ordinary expenditures ($212,790.08). But when this sum comes to be used as a basis for calculating the weekly cost per patient, it is found to yield the extravagant rate of $7.18. Here Dr. Gray proceeds to add a third division, which he calls current expenses. This term has hitherto been used to denote the monthly or quarterly sums which, added together at the end of the year, form the ordinary expenditures, and in the accounts of all public and private institutions these terms cover exactly the same items, and are in fact the same."

By reference to the reports it is easy to see the distinction that Dr. Gray has set up between ordinary expenditures and current expenses for 1874. The former amounted to $212,790.08; the latter to $157,188.07. Both are exclusive of clothing; but, to obtain the latter, and so bring the weekly average down to $5.42, the salaries of officers ($14,610.58), the amount for ordinary repairs (30,429.81), and two small items ($1,501.69) are deducted, thus reducing the total by $55,602.01. And yet the salaries of officers and the sums paid for ordinary repairs are as truly and prop-

erly to be reckoned under the head of current (running) expenses as provisions and medicines are. Dr. Gray has, no doubt, very good reasons for adopting such a distinction, apparently without a difference, as has just been designated. But, in these days of juggling with figures and accounts, even he ought scarcely to venture to introduce a novelty in account-keeping, without a foot-note explaining what it means. Of course, the true cost of each patient per week, calculated as it always is (and should be) upon the basis of ordinary expenditures, is $7.18 for the year 1874—which is 80 per cent. above the average in first-class asylums.

Take another instance. In the 1871 report, alterations and repairs ($19,705.74), farm and garden work ($11,380.47), grading ($3,585.76), together with $210.80 for water and $16.50 for sewers, are classed as extraordinary expenditures, without the least apparent reason save to reduce the weekly average per patient from $6.71, the real figures, to a factitious $4.96.

These are specimen points in the reports of Dr. Gray that will strike the analytic reader as disingenuous, if not as experimenting with figures to make a better showing than a plain statement of the facts could justify. *Prima facie*, the figures, when properly examined, furnish palpable evidences of extravagance at the Utica Asylum; and the natural presumption gathered from such novel distinctions as the superintendent makes between ordinary expenditures and current expenses, is that they were designed merely to cover extravagance and recklessness of administration. A medical superintendent, although nominally the sole responsible officer, may not, when the actual facts are exposed, be found responsible for such maladministration as the foregoing data imply. But he is responsible for any attempt, if such attempt exists, to conceal a vastly augmented weekly average by means of a mathematical legerdemain; and for this, holding ourselves ready to make the *amende honorable* should Dr. Gray offer sufficient reasons for his manner of book-keeping, it is our bounden duty as a medical journal to ask him for an explanation. The questions at issue between himself and Dr. Wilbur have assumed a cast too personal to admit of comment or to pique public interest. But the people of this city and State may well commence to ask questions, when such an expert as Dr. Conrad can describe the results of our present extravagant administration of lunatic asylums in such terms as follows: "New York State has seven lunatic hospitals now in operation, with a capacity of 3,859 patients. These seven hospitals have cost the State $3,617,122; besides which she is now building three others, at an estimated cost of $4,000,000. If the State of New York has 407 insane that become incurable cases every year, how is it possible for her to provide hospital accommodations for them at such a rate of expenditure as $1,074 per capita? Such a course would result in financial suicide to the State, and any attempt on the part of philanthropists to continue the system of hospital building for the insane must result in injury to the interests of this unfortunate class whom it is their duty to guard and protect. The system of hospital construction now pursued would cost the State at least $500,000 annually for construction alone, besides their subsequent maintenance. Governor Tilden justly condemns it. The table to which I have before referred shows that the cost of 55 of the 67 State hospitals whose cost I have been able to collect, amounts to $29,879,258, or an average cost of $543,259, or a per capita cost of $1,074. The total cost of maintaining 58 hospitals for the insane I find to be $4,803,748, or $82,819 for each one. The average cost of each patient is found to be $182. Add the interest on the total cost of buildings ($29,879,258) at 6 per cent. to the annual cost of maintaining these hospitals, and it makes $6,596,503 as the annual cost of maintaining, and increases the per capita annual cost of maintaining each patient to $249."

Such is the rapid outline of insane asylum management in the State of New York. One may, of course, set all this to the account of a bad system; but one should remember always that a bad system well administered is better than a good one badly administered. It is not exactly the fault of our system that so many unnecessarily costly hospitals are in progress in this State, and that Dr. Gray has discovered a difference between ordinary expenditures and current expenses. It is partly, perhaps, due to the fact that the medical press at large has accorded too high a confidence to so-called experts, and has consequently often forborne criticism where it was most decidedly deserved.

MEDICAL CERTIFICATES IN THE DAILY PAPERS.

In another column we give the resolutions accompanying the report of the Committee on Ethics of the Medical Society of the County of New York, regarding the publication of medical certificates in the daily papers. It is a matter of congratulation to the members of the Society and to the profession at large, that this committee has so well understood its duties, and has so satisfactorily performed them. The Society, by adopting the report, has risen to the emergency of the occasion, and in an unmistakably authoritative manner has established a precedent for future action. It has declared that the publication of medical certificates in the daily papers is a direct violation of the letter and spirit of the Code of Medical Ethics; in fact, that any action, directly or indirectly, which shall invite the attention of the laity to a medical man as a practitioner of medicine, is in the highest degree "repugnant to the high sense of honor that should govern the medical profession."

That the gentlemen who have signed the certificates for mineral waters have done wrong, no one ever

doubted, but now the protest against such an act is official and beyond a question. The Society has ordered the withdrawal of their names. Although the withdrawal has actually anticipated the report, the Committee has received no official notice to that effect. It is eminently proper that it should insist upon such notice, in order to complete its work in this particular instance. All now that remains to be done by the gentlemen who signed these certificates is to comply with such request, to admit the error they have committed, and thus end forever the writing of medical certificates for the daily papers.

We believe that the Committee acted wisely in not subjecting these gentlemen to any further discipline, as the profession has been from the start more interested in settling the principle than in punishing the individuals.

Reports of Societies.

NEW YORK ACADEMY OF MEDICINE.

SURGICAL SECTION.

Stated Meeting, January 8, 1878.

DR. STEPHEN SMITH, CHAIRMAN.

URINARY CALCULUS OF EXTRAORDINARY SIZE.

DR. JAMES L. LITTLE presented a specimen of urinary calculus, accompanied by the following history: A young man two weeks previously came under his observation, who was suffering from symptoms referable to the bladder. The chief symptom was incontinence of urine, from which he had suffered about four years. His urine had dribbled continuously. He had suffered but little pain. A sound was passed, and just before it entered the bladder a hard substance was struck. It was impossible to get the instrument into the bladder. A finger was passed into the rectum, when a large, hard substance was detected distending the neck of the bladder, and pressing on the rectum. Pressing on the perineum a hard mass was felt, which was quite readily pushed back into the bladder. The patient entered St. Luke's Hospital, and lithotomy was performed by the median operation, notwithstanding the apparent large size of the calculus. Not very much difficulty was experienced in removing the stone, because of the dilatation already existing in the urethra. When removed, the calculus was found to have an irregular shape, and measured five inches in circumference at the portion which presented in the urethra: three inches in its longest diameter; and it had an elbow-like projection which was nearly one inch in length. Somewhat more than the usual amount of hemorrhage occurred, the bulb of the urethra being unavoidably cut, and it was necessary to ligate two or three vessels. At the time of the report the patient was doing well, no unfavorable symptoms having appeared.

SOME PRACTICAL TESTS OF THE CLAIMS OF THE ANTISEPTIC SYSTEM.

THE CHAIRMAN, Dr. Stephen Smith, presented a report upon antiseptic surgery. Reference was first made to the views of John Hunter regarding subcutaneous and open wounds; that the first seldom inflamed, and that the second commonly both inflamed and suppurated. Paget had remarked regarding the doctrines of Hunter, that they embodied the principles upon which was founded the entire practice of subcutaneous surgery. The claims of the antiseptic system of treating wounds, according to Lister, were that it prevented putrefaction from taking place in consequence of the irritation produced by atmospheric germs, and reduced open wounds to the condition of subcutaneous wounds. In a case of simple fracture, the injury, though subcutaneous, was most severe, and the interstices of the tissues were filled with blood. There were present, in an aggravated form, those conditions which were followed by violent inflammation, with the exception of the open air, but, thanks to an unbroken integument, all proceeds quietly and surely towards recovery. Closing wounds was the practical result of Hunter's theory, in order to avoid the irritating effect of the oxygen in the air; but the oxygen could not be effectually excluded. The advocates of the antiseptic system aimed to render the air inert by destroying the element (microscopical organism) which gave rise to putrefaction, and which floated in the air in abundance as one of its constituents, rather than by excluding the chemical action of oxygen upon the exposed tissues.

DR. SMITH related the history of several cases which showed the value of the antiseptic system.

COMPOUND FRACTURES.

CASE I.—Compound comminuted fracture of the tibia near its middle portion; union of the bone, and recovery at the end of the eighth week.

CASE II.—Compound comminuted fracture of the tibia just below the tubercle; joint filled with blood, and blood flowed freely from the wound; temperature never rose above 100° F. At the end of the ninth week the patient was discharged with sound limb and a good joint.

ABSCESS OF THE THIGH.

CASE.—Abscess involving nearly the entire thigh and hip; free incision; discharge of clots of blood, and flakes of connective tissue in immense quantity; discharge forced out by pressure; cavity thoroughly washed out with carbolic solution; walls of the abscess immediately approximated by firm pressure; no evidence of inflammation or suppuration; abscess healed at the end of the fourteenth day.

SPINAL ABSCESS.

These cases had hitherto been regarded as incurable (Gross). Under the antiseptic system, lumbar and psoas abscesses were most hopeful cases for treatment, provided they were kept under the antiseptic plan until the sinuses were cicatrized.

CASE.—Posterior curvature of the spine involving the lower dorsal vertebræ; abscess; free incision; thorough washing with carbolic acid solution; drainage tube; slight discharge subsequently, but at the twelfth day the abscess was regarded as cured. This case was not regarded as "exceptional," for such abscesses uniformly suppurated freely when opened freely, especially in hospital cases.

SPINAL CARIES.

CASE.—Spinal caries; curvature in upper dorsal region; abscess opened; cavity thoroughly cleaned with carbolic solution; deeper parts washed out by means of a tube until the solution returned clear;

drainage tube. No symptoms of fever; no evidence of putrefaction. The opening healed, and it was believed that the caries was cured.

LIGATED ARTERIES.

Reference was made to several cases in which the carbolized catgut ligature had been used in securing arteries, and with most satisfactory results.

GUNSHOT WOUND OF THE KNEE-JOINT.

A case was related in which free incisions were made, the joint freely exposed under the antiseptic system, and the patient recovered without bad symptoms, and with fair motion.

TWO CASES OF REMOVAL OF CUBOID BONE—ABSENCE OF SUPPURATION.

Reference was made to two cases in which the cuboid bone had been removed, and neither suppuration nor inflammation followed. The wound did well, although the patients were in a very poor condition. Dr. Smith believed that the objections to Lister's method, because of its being a complicated dressing, and one requiring special skill for its successful use, were fanciful and not real. The necessary care in its application became habitual and instinctive, and in the aggregate it saved the surgeon a great deal of time, for it was not necessary to change the dressings nearly so often as when the old method was employed. The antiseptic system inspired the surgeon with confidence relating to the occurrence of gangrene, erysipelas, and the management of many cases which heretofore have been discouraging.

Dr. Little referred to cases of amputation of the breast, in which, under the use of the antiseptic system, the wounds had healed without suppuration or rise of temperature above 99° F. A large number of capital and minor operations were referred to in which he had employed the antiseptic dressings with most satisfactory results. With reference to the use of the carbolized catgut ligature it was remarked that, if the surgeon's knot was employed, it was impossible to tie the ligature sufficiently tight to cut the inner and middle coats of the artery. The square knot should be used in ligaturing arteries, and it was thought the occurrence of secondary hemorrhage, in some cases at least, might be explained by the fact that the surgeon's knot was employed.

An objection to nearly all the apparatus was that it did not produce a sufficiently fine spray.

Dr. Minor did not regard the antiseptic system as a simple process, and one which could be used without considerable extra precautions and labor; it was, indeed, quite an elaborate dressing. Nor was he able to believe that it was not just as well to douche the surface with carbolic solution as to keep the patient in a carbolic fog. The use of carbolic acid he regarded as indispensable, but that all the expensive and troublesome apparatus employed was necessary to exclude the subtle germs from a wound, appeared to him to be rather problematical.

Callender's results were very nearly equal to those obtained by Lister, and he used the carbolic acid solution, and not the spray.

At this point considerable discussion arose with reference to what became of the catgut ligature in certain cases. Did the animal tissue become vitalized, or was it displaced by a new formation which presented the same appearance as that presented by the original ligature?

The Section then adjourned.

Correspondence.

FRACTURE OF THE FEMUR IN CHILDREN.

How Extension from Above the Point of Fracture can aid Coaptation.

To the Editor of The Medical Record.

Sir:—In a general way it may be stated that fracture of the femur is the most serious of the amenable accidents which happen, suddenly, to the long bones of children. The ingenuity of the surgeon, or of the general practitioner, is sure to be severely tested when called upon to attend a case of this accident. It devolves upon him to evolve a good result by simple means. The result may be benign and satisfactory, which will be creditable to him; or it may be disastrous or deplorable, which is sure to be construed as a serious discredit to him. Hence, the lecture of Prof. Frank H. Hamilton on "Fractures of the Shaft of the Femur in Children," published in the Record of Jan. 5th, is of special interest. The best method of treating this accident is yet an unsettled question; and the manner in which the subject is discussed in that lecture is fresh, and the method of treatment progressive. Dr. Hamilton's method is an improvement, no doubt, and, probably, it is the most preferable. Two cases of this fracture in children, under my care some years ago, were treated by a method rather unusual, and resulted in a manner the most happy to each patient—a perfect limb. Perhaps the result was, in each case, an accidental occurrence; or, perhaps, the method may be founded on sound principles. So, if the Record can afford space for this report, it may be a small contribution to the history of treatment in such accidents to children.

Case I.—Peter Flood, a healthy, muscular child, aged five years, had his left thigh-bone fractured above its middle by a plank falling on it, Aug. 19, 1868. I first saw the case after he had been carried home and placed on a bed. He was lying on his left side, with his body bent over toward his injured thigh. Any attempt at approximating the body and limb to a direct line caused him to manifest intense agony, but if allowed to remain in his chosen position he did not complain much, except when hurt by the gentle manipulation necessary for arriving at a correct diagnosis. It was found that the femur was fractured a little above its middle, with a very marked deformity. His resistance to having the limb extended was an admonition to which I gave considerable heed in adopting a plan of treatment. The plan was about as follows: Having coaptated the fragments, the patient was placed on his left side on a mattress, on a single cot-bedstead, with the thigh flexed somewhat, and the knee, slightly bent, elevated four inches from the mattress by proper supports under the limb. Straps of adhesive plaster were then applied on the internal and the external aspects of the thigh, the straps commencing three inches above the point of fracture, and extending to the knee, and a little beyond it, so as to form a loop sufficient to receive a piece of board three inches square. A light bandage was then snugly placed on the limb from the toes to the groin. Outside of this, on the thigh, were placed four padded, light splints of wood, the one on the external aspect being wider and longer than the others, it extending from the great trochanter to the knee, for the thigh to

rest upon. The splints were secured by five or six pieces of bandage tied around them; which could be untied without disturbing the limb. A piece of pliable board was then placed uprightly by the side of the bedstead, and fastened to it, at a point about a foot and a half below where the knee rested, and extending about a foot and a half above the mattress. Around its upper end was placed a stout rubber ring. This ring and the loop at the knee were then connected by a piece of bandage being passed through each and tied with some considerable degree of tenseness. This tenseness signified the degree of extension force. The foot of the cot or bedstead was then elevated by bricks being placed under each foot-post. This completed the plan for three weeks; and then the wooden splints were removed and a plaster-bandage applied from the knee to the groin. At the end of seven weeks satisfactory union and firmness had been accomplished, and further treatment was merely precautionary. The first week of treatment the patient was seen by me daily; the second week, on alternate dates; the third week, once in three days; and subsequently, once a week.

CASE II.—Eddie Wells, aged 3½ years, a slender child, with small muscles and frail bones, had his right thigh-bone fractured through its middle, by falling down two steps off the stoop. I first saw the case when he had been placed in bed. His body was bent forward, and he lay on his right side. He made strenuous resistance against any attempt at extending the limb. The plan of treatment was the same as that described in the previous case; except that leather splints were used instead of wood, as the thigh was short and quite small; and also he was kept longer under close care; as his legs, before this accident happened, required artificial support to enable him to stand straight on his feet, and to walk.

The result in each case was that there was neither shortening, lameness, nor deformity. The indications kept in view in the plan adopted in the treatment of these cases were as follows:

First.—To maintain unmovable coaptation, and to do this in *accord* with the action of the muscles which act on the thigh and on the leg. This was aimed at by applying the splints, and by the partially flexed position of the thigh and of the leg. The relative attitude of the leg to the thigh, and of the thigh to the body resembled that which those parts bear to each other when a person is seated on a chair; all the muscles concerned were in favorable positions for rest and quiet.

Second.—Extension and counter-extension to be kept up by means of the least possible amount of artificial force, or pressure, or restraint applied to any part of the patient. This was aimed at by the extending force being applied in a manner immediate to the thigh, and in a direction in accord with the natural position and action of the muscles involved; and by the counter-extension being by means of gravitation of the body, and by means of support to the buttock placed under the mattress, or under the hips.

Third.—The position of the body and limbs to be such that the restraint on them should be at the minimum, and the range of accommodation at the maximum, so as to enable the patient to comply with the requirements of nature in the greatest degree compatible with the surgical necessities of the fractured limb. This indication was supposed to be fulfilled by the lateral posture of the body and of the injured limb, and by the elevated position of the knee; which posture did really afford a considerable range of motion, cautiously made, at the hip-joint of the injured limb, without communicating motion to, or making traction on the fractured parts; so that the patient in the course of a week or ten days could place his body in nearly a supine position, and not move the injured limb. This range of motion facilitated evacuations of the bowels, and afforded great relief and comfort to the opposite limbs and to the body. The leg on the injured side was easy and comfortable, and the foot—so abundantly supplied with nerves, and therefore so susceptible of suffering—was spared a great deal of misery, and remained in comparative bliss.

Another point worth noting: The adhesive straps made traction on the skin, and through the skin on the soft tissues of the thigh, a little above and around the ends of the fragments, and made this traction in a direction, and in a manner on them, especially on the upper fragment, that had a tendency to keep them in perfect coaptation, and without increasing the circumscribing pressure, which pressure, in proportion to the degree of it, has an effect to obstruct the circulation, and by that means to interfere with the process of nutrition and repair.

In the MEDICAL RECORD of December 15, 1866, there is a report, by me, of a case of gunshot compound fracture of the femur, the ball having passed through from the trochantermajor to the trochanter minor. It was a fearful accident, and seriously complicated, and yet the result was highly satisfactory. His life was saved, and a good result obtained by means of immediate extension with adhesive straps on the thigh. My experience in that case and in the foregoing two cases disposes me to believe that immediate extension on the thigh, on the principles above alluded to, is worthy of some consideration, and of further trial. Immediate extension is sometimes made on the leg when its bones are fractured; why not, then, the same plan apply to the thigh in fracture of the femur, especially in the case of children?

WM. M. DORRAN, M.D.

MOUNT VERNON, N. Y., January 21, 1878.

"HOW TO SUPPRESS QUACKERY."

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—Dr. Schweig's plan for overcoming the enemy by the use of his own weapons, as set forth in the RECORD of Jan. 19th, is so wise, and so exceedingly well-timed, that I feel strongly moved to urge its adoption.

Although he has stated the main advantages to be derived from it, there are some points which he seems to have overlooked, or at least did not dilate upon, and, therefore, I hope he will pardon me for calling attention to them.

In the first place, 'tis well known that there is no organization of power among quacks, no treaty offensive and defensive, no strong feeling of brotherly love as exists among us. On the contrary, each looks out for himself, advertises to the extent of his inclination or the depth of his pocket. Now, if we but make common cause, and advertise ourselves as a body, shall we not surely overcome quackery by *sheer weight* of metal, if in no other way?

Of course, as the doctor suggests, it would be necessary to somewhat restrict individual advertisements, and I would suggest limiting them to the space which each might be willing to pay for. To be sure this would make the annual assessments very unequal, for some men of little merit, and perhaps little value to the world, because devoid of *push*, would only demand a line, while those of great capacity for doing

good might possibly require a quarter column in order to place their merits fairly before the world. Still, as the latter would probably *incidentally* obtain greater compensation for their labors, it would not seem unreasonable to require them to pay a greater share of the expenses. Again, this inequality of spaces would give a pleasing variety to the printed pages, and prevent that monotony which appears in an alphabetical list of names, like that of advertised letters, for instance. To enhance this variety, it might be well to allow men of great ability to have their names printed in capitals, with their qualifications set forth in various sorts of ornamental type. Perhaps this might be left discretionary with the printer, as being best fitted to dress the matter up in the most attractive style.

It might be well also to advise those who wish to recommend any proprietary articles, mineral waters, etc., for general use, to give a list of them after their names and qualifications. This would aid the public in gaining all medical information required without the trouble of consulting the advertisements of quacks; and possibly the agents of articles recommended might be induced to bear part of the expense from purely benevolent motives. From time to time it might be well to illustrate the page by a picture of some hospital or dispensary, where patients can obtain the best and most skilful treatment at so much per week or month; or some distinguished surgeon in the act of operating, or a patient artistically harnessed up in some new apparatus. Such illustrations would undoubtedly add interest to the publication, and give it a firmer hold on the affections of the people.

An incidental advantage of the plan would be the saving of expense in other forms of advertising now in use; such as sending circulars to professional brethren, announcing devotion to specialties, certificates of skill from professional friends, etc. This is the more necessary as we all know that our medical journals are very much averse to advancing the true interests of the profession.

With the new plan in vogue all this would be changed, and both the profession and the public — who ought surely to have the benefits of all new discoveries in medical science — would get all the information required, at the least possible cost to the disinterested advertiser.

For these and other reasons, I am ready to engage half a column in all the leading daily papers for a year.

REFORMER.

RECTAL ALIMENTATION AND MEDICATION.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—I was greatly interested in the paper on "Rectal Alimentation," read before the New York Academy of Medicine, by Prof. Austin Flint, Sr., and published in a recent number of the RECORD, and in the interesting discussion of the paper by Drs. Barker, Peaslee, and others. I regard the subject itself as one of great practical interest, and especially for the reason that doubt has been thrown upon this mode of alimentation. My experience in this way of nourishing patients in extreme cases has been both varied and extensive, for I long since became satisfied that it was a most valuable resource in cases of necessity.

To the excellent discussion of the subject I desire to make one practical suggestion, and that is, that whatever substance may be selected, *inject it into the rectum slowly.* The rectum appears to be something like the bladder and other hollow viscera; it does not tolerate *sudden distention.* I have always made it a point to give specific directions on this point: *use tepid fluid and inject slowly.*

With caution on this point, it is astonishing how the rectum may be made to tolerate nutritive substances in liquid form. I have often used beef-juice, similar to that suggested by Dr. Peaslee, but more frequently milk mingled with beef-blood, expressed out of raw meat, and strained to remove solid particles and fatty matter. When using stimulants by the rectum, I usually add cream to the milk. Alcoholics in small quantities are readily tolerated in such a vehicle; and even mur. tinct. iron may be administered in liberal doses for a length of time, if the bowel is soothed and shielded by cream. I have seen marked effects from the use of iron in this way alone. I am inclined to think that rectal medication, as well as rectal alimentation, has not received the attention from the profession which it deserves. In a large class of chronic diseases, especially chronic diseases associated with general anæmia, in which the stomach, for some reason, does not tolerate iron (and there are many such cases), it may be used with manifest advantage and for a long time in the mode I have suggested.

S. G. ARMOR, M.D.

BROOKLYN, N. Y., January 21, 1878.

STAINING FLUIDS FOR MICROSCOPIC WORK.

BY M. N. MILLER, M.D.,

DEMONSTRATOR OF PRACTICAL PHYSIOLOGY, UNIVERSITY MEDICAL COLLEGE, N. Y.

INQUIRY is so frequently made regarding the staining processes employed in the Histological Laboratory of the N. Y. University, that I am induced to communicate the following as among the most valuable. The necessary materials are within the reach of every student, and no delicate weights or measures are needed.

I. BORAX CARMINE.—The original process given by Theirsch for the preparation of this most valuable agent is complicated and troublesome. The method, which originated with Prof. J. W. S. Arnold, of this college, gives excellent results, and is simple in the extreme. A saturated solution of ordinary borax in water is first prepared. It is best to nearly fill, say, a pint wide-mouth bottle with water, adding the borax, in coarse powder, to excess—allowing some of the crystals to remain undissolved. If good "No. 40" carmine be now added to the solution, it is immediately dissolved, and a beautiful scarlet fluid results. Continue the addition of the carmine until, after frequent agitation, it no longer dissolves, and a small portion remains at the bottom of the bottle mingled with the crystals of borax. After standing for twenty-four hours the clear supernatant fluid can be decanted. To this clear portion add about f ʒ ij. of alcohol and f ʒ i. of the U. S. P. solution of caustic soda, and it is ready for use. The method employed by Professor Arnold, which is in use in this laboratory, is to omit the alcohol, and evaporate the liquid to dryness, powdering the red amorphous mass thus obtained. This powder will keep for years, and when a staining fluid is required, it is only necessary to place from ten to fifteen grains in an ounce of water, to which about f ʒ i. of alcohol is added.

This compound will stain tissues that have been hardened in bichromate or alcohol, and is almost invaluable in pathological study.

II. HÆMATOXYLIN.—The expensiveness of this substance has led to several processes for using the log-

wood chips or extract. I have devised the following, which for results leaves nothing to be desired, and I believe it possesses merit in the simplicity of preparation, at least.

Take a pint bottle, as in the former process, fill with water, and add about an ounce of common extract of logwood, in coarse powder. Allow this to remain in a warm place for twenty-four hours, with occasional stirring. After the expiration of this time add powdered commercial alum until the liquid changes from the muddy brown color given by the logwood to a brilliant purple. The alum must be added until no change is produced. An excess of the salt will do no harm. Add about f ʒ ij. of alcohol, and, after decanting or filtering, it is ready for use. We usually omit the alcohol at this stage, and evaporate to dryness, as in the borax-carmine process. The powder thus obtained is added to water when required. Three grains to the ounce of water will give a fluid which will stain alcohol-hardened tissues in from ten to fifteen minutes. A solution containing ten grains to the ounce will stain very quickly. If it is desired to keep the solution, add f ʒ i. of alcohol to each ounce.

III. Picro-Carmine.—Ranvier gives an exceedingly troublesome process for obtaining this complex substance, and it has frequently failed with myself, as it is difficult to ascertain when the solution becomes neutral. I have never had any but successful results with my process, which consists merely in adding one part of a saturated solution of picric acid to two parts of the fifteen-grain borax-carmine solution. I believe this mixture will keep indefinitely, although I have never kept it longer than six months. I now have a sample that was made early in the past summer, and it is still perfectly good. A section of skin is one of the most beautiful objects prepared with the picro-carmine, as the epithelium of the glands and the muscles are stained yellow, while the nuclei of the cells and the connective tissue acquire the carmine color. It is not, however, well adapted to tissues hardened in chromic acid.

Sections, after having been stained in the borax carmine, should be washed in alcohol to remove the superfluous coloring fluid, transferred for a few moments to a saturated solution of oxalic acid in alcohol, to fix the color. The oxalic acid is then washed out in alcohol, when the sections are cleared up in oil of cloves, and mounted in balsam or dammar. If it is desired to mount in glycerine—which, by the way, meets with very little favor here as a universal medium—the oxalic acid can be washed out with water, instead of alcohol.

Hæmatoxylin stainings are soaked in water for a few moments—to wash out the alum—transferred to alcohol, clarified in the clove oil, and mounted in Canada balsam or dammar varnish. Especial care must be taken that the vessels employed be clean, and that no acid comes in contact with the sections. If the fluid becomes muddy, or a scum forms upon the surface, it is only necessary to filter.

Sections must remain in the picro-carmine generally for about twenty-four hours. They are then washed quickly first in water and then in alcohol, after which transfer to the oil of cloves. The sections having been transferred to the slide, and the superfluous oil removed, the balsam or dammar (preferably the latter) is added, and the cover applied.

I have not directed the use of distilled water in making the solutions, as it is not essential. With us the "croton" answers every purpose, as the solutions are all either filtered or decanted.

410 E. 26th St., November, 1877.

TREATMENT OF DIPHTHERIA.

To the Editor of The Medical Record.

Dear Sir:—Dr. W. B. Rodman, of Frankfort, Kentucky, paid me the compliment of referring to my article of January 12th on the Treatment of Diphtheria, in his of January 26th. It is very evident, however, that he had not paid *it* the compliment of reading it. Had he done so he could not have confounded or associated as he did the method of treatment which it advocates with that presented in another article in another journal to which he also refers. These methods not only differ throughout in details, which are far from trivial, but are diametrically opposed in respect to several points of primary importance. "Let every tub stand on its own bottom." In attempting to combine the contents of the two in question the doctor is decidedly mixing incompatibles. But for the fact that the *embarras de richesse* of modern medical literature compels the busy practitioner to pass over many articles with only a hasty glance, I should not have thought it worth while to encroach upon your space, or my own time to call attention to the doctor's error. The statements in both articles concerned are explicit enough.

The doctor's assumption that no method of treatment which includes the employment of old and familiar drugs can possess any just claim to originality, I shall not now discuss, having already referred to it in the article of Jan. 12th.

Very respectfully,
C. E. Billington, M.D.

157 Lexington Avenue.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from Jan. 20, 1877, to Jan. 26, 1878.

Barnett, R., 1st Lieut. and Asst. Surgeon. Relieved from temporary duty in the Medical Director's office, and assigned to temporary duty at Little Rock Barracks, Ark., during absence of Asst. Surgeon Bentley. S. O. 10, Dept. of the Gulf, Jan. 18, 1878.

Spencer, Wm. G., 1st Lieut. and Asst. Surgeon. Assigned to duty as Post Surgeon at Fort Townsend, W. T. S. O. 4, Dept. of the Columbia, Jan. 7, 1878.

St. Luke's Hospital.—Dr. Charles W. Packard has been appointed Consulting Physician to St. Luke's Hospital, in which institution he has just completed his term of ten years' service.

RESOLUTIONS ACCOMPANYING REPORT OF THE COMMITTEE ON ETHICS TO THE COMITIA MINORA OF THE MEDICAL SOCIETY OF THE COUNTY OF NEW YORK:

Resolved: That for a physician to permit the use of his name, or professional reputation, in commendation of any drug, medicine, wine, mineral water, nostrum, proprietary article, or medical preparation, or of any surgical instrument or appliance whatsoever, for the purpose of advancing the pecuniary interests of any inventor, patentee, originator, discoverer, manufacturer, proprietor, or advertiser of such article or appliance, is an unworthy act.

Also, that for a physician to publish, or allow to be published in the journals, public prints, or other publications intended for the use of the laity, reports of medical or surgical cases, or papers on medical or surgical subjects, for the purpose of attracting the attention of the general public to the author, is repugnant to the high sense of honor that should govern the medical profession.

These are the devices commonly resorted to by quacks and impostors, and have for their end the attainment of fame and notoriety by other means than those efforts in the line of professional duty which are the honorable physician's only legitimate paths to advancement in the confidence and patronage of the public.

In view of the foregoing resolutions, whereas, it has come to the notice of this Committee that certain waters—known as Apollinaris and Hunyadi Janos—also certain wines and other medical articles, are extensively advertised in the public journals and by handbills throughout the country;

And, whereas, the names of certain members of this Society appear in connection with medical certificates in said advertisements;

And, whereas, such action is in plain violation of the letter and spirit of the Code of Ethics as well as of the foregoing resolution of this Committee:

Therefore,

Resolved, That the gentlemen whose names appear on said certificates be requested to withdraw or cause the withdrawal of their names and certificates from said advertisements.

Also, it is requested that due notification of the action taken by said gentlemen, individually or collectively, in this matter, be transmitted to the Committee on Ethics, that the Committee may be able to report on the same at the next meeting of the Society.

R. A. BARRY,
Chairman Committee on Ethics.

R. J. O'SULLIVAN,
Secretary.

NEW YORK PATHOLOGICAL SOCIETY.—The following officers have been elected for the ensuing year: President, Dr. John C. Peters; Vice-President, Dr. E. C. Seguin; Secretary, Dr. Geo. F. Shrady; Treasurer, Dr. John H. Hinton.

INSPECTION OF PROVISIONS AT BERLIN.—A Petition for the Establishment of a Bureau for the Inspection of Provisions, etc., in Berlin, was recently presented by the Landlords' Club of Berlin to the authorities of that city. The articles mentioned in the petition as especially requiring inspection are water, beer, wine, coffee, tea, chocolate, sugar, spices, meal, bread, meats, butter and other fats and preserves. The bureau should have power to examine these and other articles of food and drink, for impurities and adulterations, and to see that no articles are exposed for sale in a condition prejudicial to health. It is also proposed that the bureau should be invested with a general supervision of prices, and the power to regulate them if necessary for the interest of the public. It may be of interest to our readers to know that in the year 1875 the consumption of milk per capita in Berlin was about 40 quarts; of wine, about 11 quarts; and of beer, about 157 quarts.

CHOLERA IN JAPAN.—According to recent advices from Japan, the epidemic of cholera which broke out not long ago in the city of Yokohama has spread widely over the country, and especially along the coast. The disease is said to be particularly virulent among the troops who have returned from Satsuma and are now in Hiogo. Opinions are divided as to the origin of the disease. Some believe that it was transported from Shanghai, and others that it originated among the troops in Satsuma. The epidemic in its spread has followed the lines of trade and commerce, especially along the coast. According to the official reports, there had been up to the 5th of October, 575 cases of cholera in Yokohama and its suburbs; of these, 233 proved fatal. In Tokio, up to October 8th, there had been 204 cases and 97 deaths. The German colony in Yokohama, and the crews of two men-of-war in the harbor, had not suffered from the epidemic up to the latest advices.

DR. GIRSZTOWT, Professor of Surgery, and editor of the medical journal (*Gazeta Lekarska*) in Warsaw, died recently of the results of an injury. A compositor, who had been discharged from the printing-house, entered the editor's room on the 5th of November and stabbed him beneath the left Poupart's ligament with a case knife. Both the femoral artery and the crural nerve were divided by the blow. The wounded man compressed the artery himself until assistance arrived, when it was immediately secured by ligature. The loss of blood, however, was considerable, and eventually led to the fatal termination. Dr. Girsztowt was one of the most esteemed and successful physicians in Warsaw.

THE LATE DR. HANDSEL GRIFFITHS.—*The British Medical Journal* informs us that the death of Dr. Griffiths has left his family in great need, and that some of his professional friends are endeavoring to raise a benefit fund so as to enable his widow to furnish a house and make a struggle for the maintenance of herself and her little ones. This is, after all, the old story, and shows how first-class talent is sometimes rewarded. Plenty of reputation, but penniless heirs. A drygoods man with half the opportunity and a quarter of the brains would have made a fortune.

PRUSSIAN SURGEONS IN ROUMANIA.—We learn with pleasure that the item with this heading, published a few weeks ago in the RECORD, is incorrect. It is true that the Prussian surgeons who went to Roumania at the request of the Princess of Wied, were at first coolly received, but the coolness was experienced at the hands of the Roumanian ladies, who were acting as nurses in the hospitals of Bucharest, and not at the hands of the Roumanian surgeons. The ladies acted under the influence of a strong prejudice against the German nation, which, however, was soon replaced by hearty esteem and admiration for the devotedness and skill of their Prussian visitors. The French Inspector-General, of whom mention was made, has control only of the field-hospitals south of the Danube, and has not come in contact with the Prussians at all. All the hospitals on this side of the river are under the control of three Roumanian physicians, who were educated

in German universities, and who cherish the heartiest admiration for their German teachers. Only one of the Prussian surgeons has returned home. All the rest are still engaged in various hospitals, and the value of their services is cheerfully admitted by all the Roumanian surgeons who are cognizant of their work. The Prussians are themselves well satisfied with their position. Their pay is higher than that of their Roumanian co-laborers.

PULSATILLA appears to have been an ancient remedy, recommended by Dioscorides and Pliny, and used by the earlier Arabian physicians; its revival was principally due to the labors of Baron Stoerck. The Baron's mode of administration was peculiar, for he had it rubbed up with sugar-of-milk, just as Hahnemann subsequently directed. Stoerck gave the first great impetus to its use in 1771, since which time all German physicians have used it, while Hahnemann only commenced to appropriate it in 1812. It is a singular fact that the latter used or recommended it in few or no diseases against which it had not been previously employed in rational and efficient doses.—*J. C. Peters, M.D., Boston Medical and Surgical Journal.*

VALENTINE'S MEAT JUICE.—Prof. J. Foster, of Munich, has examined this preparation and published the result in the *Pharmac. Post*, and *Hager's Pharmac. Centralhalle*. The sediment consists chiefly of magnesium phosphate; the liquid has a slightly acid reaction, and contains water 59.16 per cent., solid substances 40.84 per cent. The latter consists of ashes 13.88 per cent., and substances destructible by heat 26.96 per cent. The ash is approximately the same as that of beef-tea. The destructible substances are albumen, 0.73 per cent., nitrogen 3.45 per cent., substances insoluble in strong alcohol, 20.50 per cent.

This preparation would probably not be found very nutritious. It differs from Liebig's Extract of Meat only in its larger proportion of water, and in its traces of albumen. The absence of fat, which is put forth as one of its claims to notice, might in many cases prove a disadvantage rather than an advantage.

NEW YORK ACADEMY OF MEDICINE.—At a stated meeting of the Obstetric Section, held Jan. 21, 1878, Dr. Salvatore Caro was elected President, and Dr. Henry E. Crampton, Secretary.

CONSUMPTION OF ALCOHOLIC DRINKS IN FRANCE.—The following facts were taken from a paper recently read by M. Lunier before the *Académie de Médecine*.

The alcoholic drinks consumed in France are wine, cider, beer, brandy, and liqueurs. Wine is the true national drink; during the last ten years the annual consumption has been 1,325,000,000 gallons, being 126 gallons per head. There have been oscillations in the consumption corresponding to those in the production, but in general the former has increased progressively during the last fifty years. From 1829 to 1833 the consumption was only from 58 to 63 gallons per head. Wine is really the universal drink only in 72 of the departments, and in these the quantity used varies from 40 to 380 gallons per head.

The consumption of cider has diminished during the last twenty years. This does not, however, constitute a cause for regret, since, in consequence of the bad quality of the cider, brandy is very generally added to it as a corrective. It constitutes the current drink in nine departments, situated on the north-west frontier. The annual consumption in these departments is 79 gallons, and in France generally 21 gallons per head.

The consumption of beer has increased progressively without interruption during the last fifty years. In 1829 it was only 8¼ gallons, and now it is 23 gallons per head. Beer constitutes the general drink in only four departments, which are grouped along the Belgian frontier. The average individual consumption there is from 79 to 231 gallons. Complaints of the bad quality of the beer have been rife of late, and it is not improbable that it will soon become customary to add gin to it as a corrective.

The consumption of strong alcoholic drinks has increased progressively during the last forty years; in 1839 it was two gallons, and now it is three gallons per head. Alcohol is consumed most largely in the departments in which wine is not made, very little being consumed in the latter. Statistics confirm the opinion enunciated by M. Bergeron in 1870, that the noxious action of manufactured liquors is far more intense than that of brandy made from wine. The following conclusions may be deduced from the statistics collected by M. Lunier:

1. Of the accidental deaths due to excessive drinking, the great majority occur in the departments in which large quantities of alcohol are consumed. Conversely they are rare in the wine-drinking departments.

2. The cases of prosecution for drunkenness are five times more numerous in the departments which consume chiefly alcohol than in those which consume wine.

3. The same may be said with regard to the cases of insanity due to alcoholism; the number stands almost everywhere in a direct ratio to the consumption of liquors, and especially of manufactured liquors. Vendée and the Charente-Inférieure form almost the only exceptions to this rule. In those departments white wines form the principal drink, and they are almost as dangerous as brandy in this respect.

ARE THERE LAWS OF THERAPEUTICS?—Under the above title, Dr. Rabagliati contributes a paper to the *Practitioner*, September and November, 1877, in which he sets forth the following propositions, that he believes to be capable of substantiation?

"Prop. A.—Different remedies tend to act upon different parts of the human economy.

"Prop. B.—The effects of remedies are proportionate to the *quantities in action*, and universally as the resistance of the persons acted upon." In commenting upon this proposition, he draws attention to the fact that "quantities in action" and quantities administered are not necessarily identical, as only a portion of the latter may be absorbed. He further states that he has himself seen salivation induced by the continuous administration of $\frac{1}{1000}$ of a grain of bichloride of mercury three times a day, when no such result has followed doses of $\frac{1}{16}$ of a grain to a much larger gross amount.

"Prop. C.—All remedies whatever which affect the economy exert upon it at least a two-fold and contrary action in time. If these be called action and reaction, or primary and secondary, one may otherwise state this proposition in the following form: the secondary action of any and all acting remedies is contrary to the primary.

"Prop. D.—Different quantities of different but similarly acting remedies are required to produce given effects upon bodies of equal resistance.

"Prop. E.—The time after which reaction succeeds action is different in the cases of differently constituted bodies." Although the above propositions may appear to be somewhat vaguely stated, a perusal of the paper in full will afford much food for thought.

SCHOOL OF PRACTICAL HISTOLOGY 11

INSTRUCTION IN OPHTHALMOLOGY AND OTOLOGY 11

IMPORTANT TO PHYSICIANS.

Physicians practising in the Southern and Western States, are usually careful in designating (WARNER & Co.,) when writing prescriptions for Pills, as they have derived the most beneficial and uniform results from the use of these preparations. It would be well for physicians everywhere, to exercise this same caution when prescribing pills, of Quinia and Phosphorus, as well as other kinds.

Twenty years experience has demonstrated that the covering of pills with sugar, affords the acme of perfection, when the coating is properly applied, and for this reason, WARNER & Co's, are superior to all other sugar-coated pills in the market. They possess advantages in every respect, over those coated with gelatine. Sugar is more soluble than gelatine and when necessary, is applied to pills, so soft as not to retain their form uncoated.

They are beautiful in appearance, more acceptable to the patient, more readily swallowed than the oval or pointed shaped pills, with their sticky coating.

Doctors who had formed a prejudice which caused them to favor gelatine-coated pills, on account of their much vaunted merit for solubility, write us, that their delicate patients revolt at their ugly color and shape. Physicians throughout the country have it in their power to disprove their claim for greater solubility, as samples of gelatine-coated pills, in small paper boxes, have been extensively distributed within a comparatively recent date.

After being kept for a time, they become hard and brittle. The enclosed mass, as well as the gelatine coating, losing all its moisture. This proves that gelatine is not non-pervious, and is certainly not the proper material with which to protect medicinal substances, especially Phosphorus in pilular form.

The original manufacturer of gelatine-coated pills, conveys the information that two coats of shellac varnish were applied before the covering.

Prof. Remington, of the Philadelphia College of Pharmacy, demonstrated long ago, by practical experiments, that sugar-coated pills are more soluble than those gelatine-coated.

ALWAYS SPECIFY "K. & M." GRANULATED EFFERVESCENT SALTS.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

MESSRS. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen,—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KERN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

MESSRS. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

MESSRS. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

Business worth $6,000 per annum; house and furniture worth $12,000. Inquiries may be made of GEO. F. SHRADY, M.D., Editor of "Medical Record," or by addressing "MEDICAL EXCHANGE," care FRANK J. FRENCH, Esq., No. 528 California St., San Francisco, Cal.

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case $9 00
Quarts, 2 dozen in a case 7 00

In Saratoga. *Delivered at the Cars.*

Pints, 4 dozen in a case $8 00
Quarts 2 dozen in a case 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.,** or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.

A COMPETENT PHYSICIAN,

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops,** viz.: Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46 1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT,			**With Hops (Plain),**	**$1 00**
"	"	"	**Pyrophosphate of Iron (Ferrated),**	**1 00**

(P. O. Box 4,517), 2 and 4 Platt Street, New York

LOEFLUND'S EXTRACT OF MALT

Is recommended to physicians for its **purity** and **superiority** over all others. It is perfectly free from **Alcohol, Carbonic Acid and Empyreumatic Products**, which can only be attained by the **most careful manipulations** in its manufacture, **long experience**, and by means of **unexcelled apparatus**. Mr. Ed. Loefund, of Stuttgart, Germany, manufactures only Malt preparations, devotes his whole time to these; and being a thorough Chemist, makes a preparation based upon **scientific principles**. For this reason his Preparations were awarded a **prize** at the **Centennial Exhibition. Loefund's Concentrated Extract of Malt** is a **Resolvent Emollient** and most powerful **Nutritient**. It is used for diseases of the **respiratory organs, pulmonary complaints**, and for diseases originating in **imperfect digestion**. **Price per bottle, 75 cents.**

Loefund's Extract of Malt with **Pyrophosphate Iron.**
" " " **Citrate Iron and Quinine.**
" " " **Iodide Iron.**

Loefund's Extract of Malt with **Hypophosphite Lime.**
" " " **Pepsin.**
" " " **Hops.**

Each of these **$1.00 per bottle.**

Loefund's Concentrated Leibig's Food for Infants (Leibig's Soup for infants in a concentrated form), **ready for use**, has been pronounced by the Judges of the Centennial Exhibition: **A perfect Substitute for Mother's Milk**, and therefore awarded a prize. Price, 75 cents per bottle.

Circulars giving full particulars will be mailed to all parts upon application.

CAUTION TO THE TRADE AND PUBLIC.—The labels on Loefund's Preparations should be carefully examined. The signature of ED. LOEFLUND appears on the right lower corner of the genuine label; in the centre, the *Trade-Mark*; and on the *left lower corner*, the words: Sole Agent for America, ALBERT C. DUNG, Druggist, 61 Bowery, New York.

The genuineness of these only is guaranteed. All labels are printed in the *English Language*.

Loefund's Extract of Malt Lozenges contain a large proportion of **Extract of Malt**, and are **very efficacious**, as well as highly agreeable **Cough Lozenges**. Price 25 cents per package.

All the above preparations are kept by the leading druggists. Orders by mail promptly filled by

ALBERT C. DUNG, 61 Bowery, New York.

VACCINE VIRUS.

In order to meet properly the continued demand upon us for **Animal Virus**, we have established stables for its propagation upon carefully-selected heifers. The lymph used is of the well-known "Beaugency" stock, imported by ourselves expressly for this purpose. The result of several years' experience in supplying this lymph leads us to believe that its excellence is unsurpassed. The establishment is under the care of a competent physician, who will spare no pains to produce a perfectly reliable and **pure** article, which we are prepared to furnish **fresh, daily.**

We can also furnish, to those who prefer it, **Humanized Virus**, from healthy children, procured for us by physicians of undoubted reliability.

All our Virus is put up in strong, *air-tight, sealed packages*, for safe conveyance by mail or express, and will be sent (postpaid if by mail) upon the following terms:—

From the Heifer, 10 large Ivory Points, well charged on both sides			$1.50
5 large Ivory Points,	"	"	.80
Large Ivory Points, less than 5,	"	" each	.25
1 Crust, new method, in air-tight Glass Capsule			2.00
From Healthy Infants, 10 small Ivory Points			1.50
1 Crust from Unruptured Vesicles			2.00

Directions for vaccinating with either form of Virus, derived from methods successfully employed, will be furnished with Virus if requested.

We will warrant every package of Points and every Crust, giving a fresh supply in case of failure reported within fifteen days for Points, thirty days for Human, and ninety days for Kine Crusts. We can usually furnish Crusts one remove from the heifer if preferred.

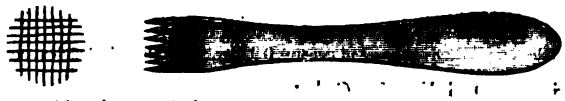
On account of their unreliability, we have hitherto furnished the usual form of Kine Crust unwillingly. Under our new method of taking and preserving them, however, after careful tests and an experience extending over several months, the results obtained have been so satisfactory that we now offer them as not less active and reliable than other forms of Virus, while less liable to become inert with lapse of time. We now offer them on very favorable terms, and recommend them for transmission to a distance, and in all cases where it is desired to preserve Virus for some weeks or months, or to keep a supply at hand for emergencies.

We also furnish **Uncharged Ivory Points**, for physicians' use, at the following rates:—

Small	per 100, 25 cents; per 1,000, $2.00
Large	per 100, 50 cents; per 1,000, 4.00

Orders by mail or telegraph answered by return train.

Liberal discounts upon large supplies for Cities, Towns, and Institutions.



Scarifying Vaccinator, Steel Nickel-Plated. See Cut. Each 25 Cents.

(EXTRACT OF MALTED BARLEY, WHEAT AND OATS.)

THIS PREPARATION CONTAINS FROM THREE TO FIVE TIMES THE MEDICINAL AND NUTRITIVE ELEMENTS FOUND IN EXTRACT OF MALT.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat* and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST: In the manufacture of ***MALTINE*** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates and Albuminoids on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity possessing little virtue aside from the saccharine matter which it contains.

SECOND: Carbon, Hydrogen, Nitrogen, Phosphorus, Sulphur, Iron, Magnesium and *Potassium* are essential elements in the food of man; and it is only in ***MALTINE***, containing the combined properties of malted *Barley*, *Wheat* and *Oats* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD: Gluten is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. ***MALTINE*** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH: The bony structure and muscular development of man cannot long be sustained without the Phosphates and nitrogenous alimentary elements, of which ***MALTINE*** contains all of three times the proportion found in any Extract of Malt made from Barley alone—when perfectly made, but when a too high degree of heat has been employed, these principles are almost wholly destroyed.

We believe that any practitioner will readily recognise the superiority of ***MALTINE,*** *and would request a trial and comparison of merits with any article offered for similar uses.*

MALTINE AND ITS COMPOUNDS

Can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, Imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULAS AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**
This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOSPHATES IRON AND QUINIA:**
A powerful general and nutritive tonic.

***MALTINE* WITH PHOS. IRON, QUINIA AND STRYCHNIA:**
A powerful nutritive, general and nervous tonic.

***MALTINE* WITH HYPOPHOSPHITES:**
This preparation is specially indicated in Phthisis, Rickets and deficient Ossification.

***MALTINE* WITH PEPSIN AND PANCREATINE:**
One of the most effective combinations in Dyspepsia, Cholera Infantum and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the ***MALTINE***. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**
One of the most valuable combinations in cases of general Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH COD LIVER OIL:**
The most perfect emulsion, and most agreeable and effective mode of administering this nauseous but valuable Oil yet discovered.

***MALTINE* WITH COD LIVER OIL AND PHOSPHORUS:**
In this combination the Phosphorus has no irritant effect upon the stomach.

***MALTINE* WITH COD LIVER OIL AND IODIDE OF IRON:**
This is prepared with the tasteless Iodide of Iron, which undergoes no chemical change from contact with the Oil, and does not blacken the teeth.

***MALTINE* WITH ALTERATIVES:**
In this preparation ***MALTINE*** is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.
Each fluid ounce contains: *Chloride Calcium*, 10 grains; *Chloride Magnesium*, 10 grains; *Bromide Sodium*, 5 grains; *Iodide Potassium*, 1 grain; *Iodide Iron*, ½ grain. DOSE, One teaspoonful to one tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only*.

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in amber bottles holding sixteen fluid ounces; each bottle inclosed in a folding paper box.

REED & CARNRICK, Manufacturing Pharmacists,

196 and 198 Fulton Street, New York.

LEUBE'S MEAT SOLUTION.

Freshly prepared, in one pound glass jars always on hand.

For formula and use see Ziemssen's "Cyclopædia of the Practice of Medicine," Vol. 7, page 228; and Vol. 12, Special Note before Table of Contents; and N. Y. MEDICAL RECORD, Jan. 19, 1878, page 58.

"Of all the meat-preparations the *only reliable* one is Leube's Solution, made by Hoffmann's Formula."—Dr. E. R. PEASLEE, *Proceed. N. Y. Acad. Medic.*, *Dec.* 20, 1877.

As the Meat Solution does not keep long, its freshness can only be guaranteed by ordering *direct from the manufacturer*. Orders by postal-card or telegraph promptly attended to.

For Samples, address **C. AM ENDE, Hoboken, N. J.**

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHES, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of **CASWELL, HAZARD & CO., New York,** and of all respectable Chemists throughout the world.

VANITY FAIR

FOR MEERSCHAUM AND CIGARETTES.

SCHOOL
OF
PRACTICAL HISTOLOGY

No. 446 Fourth Avenue,

NEW YORK CITY.

This school will remain open for Practitioners and Students until July 1, 1878. It will then be closed for three months, to re-open October 1, 1878.

1.—GENERAL NORMAL HISTOLOGY. By Drs. THOMAS E. SATTERTHWAITE and J. A. MCCREERY.

2.—GENERAL PATHOLOGICAL HISTOLOGY. By Drs. THOMAS E. SATTERTHWAITE and JOHN A. MCCREERY.

3.—NORMAL AND PATHOLOGICAL HISTOLOGY OF THE NERVOUS SYSTEM. By Dr. E. C. SEGUIN.

Special instruction will be given in the Minute Anatomy of the Eye and Ear by Dr. C. S. BULL, and in Skin Diseases by Dr. A. R. ROBINSON.

New classes will be formed March 1.

THE FOLLOWING COURSE OF INSTRUCTION
— IN —
Ophthalmology and Otology
WILL BE GIVEN AT THE
N. Y. Ophthalmic and Aural Institute,

No. 46 East 12th Street,

From March 1st to the beginning of June.

1.—**Histology of the Eye and Ear.** By Dr. E. GRÜNING.

2.—**Physiological Optics and Acoustics.** By Dr. H. Knapp.

3.—**Ophthalmoscopy and Otoscopy.** By Dr. T. R. Pooley.

4.—**Functional Examination of the Eye and Ear.** By Dr. E. GRÜNING.

5.—**Practical Exercises in Operating.** By Dr. H. KNAPP, assisted by Dr. T. R. POOLEY.

6.—**Ophthalmic and Aural Clinics.** By Dr. H. KNAPP.

The first five courses will be given once a week; the clinics three times a week. The students will have the privilege of attending the daily Dispensary and witnessing the operations.

Fee for the whole course, $30; for each course taken separately, $10.

Western Electric Manufacturing Co.

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,

GALVANIC BATTERIES,

BATH APPARATUS, &c.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8¼ x 7¼ x 4½. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

WESTERN ELECTRIC MANUFACTURING CO.

20 New Church St., NEW YORK. 220 to 232 Kinzie St., CHICAGO.

PRIZE MEDAL, PARIS MARITIME EXHIBITION, 1875.

NEAVE'S FOOD

FOR

INFANTS

AND

INVALIDS,

Is pre-eminently rich in albumenoids and phosphates, and the starch which it contains is in a state readily assimilated by the infantile digestion.

NEAVE'S FOOD has received the high and unqualified approval of eminent medical men for many years past. It usually commands a ready sale, both in Great Britain and in the States, for it is strongly recommended by mothers to the notice of their lady friends; and infants often give it a preference, refusing other foods. As a natural result, the sale has extended rapidly, especially during the past four years, necessitating the erection of extensive premises, again enlarged in December, 1876, where the preparation is carried on under the personal supervision of Mr. Neave.

NEAVE'S FOOD is sent in large quantities to the Colonies and to the United States. It is prepared with special reference to exportation.

NEAVE'S FOOD is sold in tins and tinfoil packets by chemists and storekeepers at home and abroad.

For terms, apply to any wholesale or export house, or to manufacturers,

JOSIAH R. NEAVE & CO., Fordingbridge, England.

☞ Doctors and Medical Practitioners wishing to try Neave's Food are requested to apply for a Sample Packet (gratis) at the undermentioned Agency.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine. Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

LAZELL, MARSH & GARDINER'S POWDERED MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts*.

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz.		per oz.

FOUGERA'S COMPOUND IODINIZED COD LIVER OIL

Since the introduction of this oil in 1858 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine,** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of, 10 plasters each. DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

Hunyadi János Mineral Water

THE BEST NATURAL APERIENT.

THE LANCET.

"HUNYADI JANOS.—Baron Liebig affirms that its richness in aperient salts surpasses that of all other known waters."

THE BRITISH MEDICAL JOURNAL.

"HUNYADI JANOS.—The most agreeable, safest and most efficacious aperient water which has been brought under our notice."

From Prof. MACNAMARA, Prof of Materia Medica, Royal College of Surgeons in Ireland; Editor of "Neligan's Medicines, their Uses," &c., 7th edition.

"Far the most valuable and palatable of our Aperient Mineral Waters. I have been most agreeably surprised with the result of a clinical investigation."

From Professor AITKEN, F.R.S., Professor of Pathology, Army Medical School; Author of the "Science and Practice of Medicine," 6th edition.	"Those who have used Pullna and Friedrichshall prefer the Hunyadi János Water to either, because the bulk of the dose is less than either of those waters, and the action is less drastic, producing no distress or uneasiness."
From Professor T. LAUDER BRUNTON, F.R.S., Professor of Materia Medica and Therapeutics at St. Bartholomew's Hospital; Examiner in Materia Medica, University of London.	"More frequently prescribed than any other by Physicians in the General Hospital, Vienna: its taste being more pleasant than that of its rivals, while its efficacy as a purgative equaled or surpassed theirs."
From Professor Dr. VIRCHOW, Director of the Pathological Institute, Berlin.	"I have tried the Hunyadi János water sent me on a large number of persons, with invariably good and prompt success. It is a most valuable item in our Balneological treasury of remedies."
From Professor Dr. von BAMBERGER, Director of the Medical Klinik in the University of Vienna.	"I have prescribed the Hunyadi János waters with remarkable success in all those diseases for which aperient waters are used."
From Professor Dr. SCANZONI (von LICHTENFELS), Professor of Medicine in the University of Wurzburg.	"After having made a large number of experiments extending over many years, I prescribe none but this."
From Dr. J. MARION SIMS, Consulting Surgeon of the Women's Hospital, New York, Honorary Fellow of the Obstetrical Societies of London, Dublin and New York.	"As a laxative, I prefer the Hunyadi János to any and every other mineral water, and for the following reasons: The dose is small; the taste is not unpleasant; it acts promptly; it does not oppress the stomach; it does not gripe, and it is efficient."
From Dr. FORDYCE BARKER, Professor of Clinical Midwifery and Diseases of Women, Bellevue Hospital, New York.	"It requires a less quantity; that it is less disagreeable to the taste; less unpleasant in its efficient action, and more certain as an aperient, than any of the waters that I have before been accustomed to prescribe."
From Dr. von BUHL, Professor of Medicine in the University of Munich.	"Among all known aperient waters, the Hunyadi János water indisputably occupies the first position."
From Dr. JAMES R. WOOD, Emeritus Professor of Surgery in Bellevue Hospital Medical College, and Surgeon to Bellevue Hospital, New York.	"It is generally a certain but gentle and painless aperient. In my experience it is superior to any other Bitter Water."
From Dr. WILLIAM A. HAMMOND, Professor of Diseases of the Mind and Nervous System in the University of the City of New York.	"According to my experience, the most pleasant and efficient of all purgative mineral waters."
From Dr. ALFRED L. LOOMIS, Professor of Pathology and Practice of Medicine in the Medical Department of the University of the City of New York; Visiting Physician to Bellevue Hospital.	"The most prompt in its action and the most efficient of any of the aperient mineral waters. Specially adopted to those persons who daily require the aid of cathartics."

For ordinary aperient purposes a half wine-glassful of the Hunyadi Water may be taken at bed-time, or a wine-glassful taken in the morning fasting. It is most efficacious when warmed to a temperature not below 60° or when an equal quantity of hot water is added to it.

Every genuine bottle bears the name of the Apollinaris Co., Lim., London, England.

MAY BE ORDERED OF ALL DRUGGISTS, GROCERS & MINERAL WATER DEALERS.

SOLE AGENTS FOR THE UNITED STATES AND CANADA,

FREDERICK de BARY & CO., 41 and 43 Warren St., New York.

APOLLINARIS WATER.

From R. OGDEN DOREMUS, M.D., LL.D.,

Professor of Chemistry and Toxicology in Bellevue Hospital Medical College and Professor of Chemistry and Physics in College City of New York.

Last Summer our Croton Water was remarkably polluted. It teemed with animalculæ; its odor was uninviting; its taste was unpalatable; and its effects upon the system unwholesome. Unfortunately this has occurred each warm season, and will happen in a more or less marked degree every Summer.

It is well known that many cities suffer from impure water.

Eminent physicians in Albany attribute the increased sickness and mortality in the capital of our State to the water supplied from the Hudson River.

In rural districts, the drainage from the residence frequently contaminates the well water to such an extent as to produce prostration and death. Many ingeniously devised filters have been presented to the public; they are effective in removing certain objectionable particles, but the impurities of the most vital importance still remain.

The delusion applies also to aerated waters, which to the eye appear transparent and sparkling, yet at times are magazines of disease.

I find on careful examination that the *Apollinaris Water is entirely free from all such organic impurities.*

Its freedom, also, from metallic poisons already referred to enables the chemist to coincide with eminent medical authorities in commending it as an *absolutely pure, wholesome, as well as pleasant mineral water, superior to all others as a daily beverage.*

APOLLINARIS WATER—"Far superior in flavour and quality to ordinary manufactured aërated waters, and useful in preventing gouty and dyspeptic disorders."—*The Practitioner.*

APOLLINARIS WATER—"The favoured drink of the favoured classes."—*London Medical Record.*

APOLLINARIS WATER—"An article of diet, alike refreshing, agreeable, and of great value."—JAMES PALFREY, M.D., Obstet. Physician to London Hospital, etc., etc.

APOLLINARIS WATER—"Exhilarating; good for loss of appetite, nausea, and dyspepsia."—*Companion to the British Pharmacopœia*, by PETER SQUIRE, F.L.S., Chemist to the Queen.

APOLLINARIS WATER—"Incomparable for mixing with Wines and Spirits."—H. VIZETELLY, British Wine Juror at the Vienna Exhibition.

APOLLINARIS WATER—"Far superior to ordinary aërated Waters."—*Medical Times and Gazette.*

APOLLINARIS WATER—"Highly estimated by those who have made Aërated Waters a study."—*Medical Press.*

APOLLINARIS WATER—"The type of purity."—Professor BARTLETT, F.C.S.

APOLLINARIS WATER is strongly recommended by Dr. PETER HOOD, as superior to Vichy and Vals."—*Treatise on Gout and Rheumatism.*

APOLLINARIS WATER—"I have used the water myself for above a year and a half. It is a most refreshing beverage, highly restorative, and well adapted to relieve most of the dyspeptic constitutions that English stomachs are so peculiarly liable to."—JAMES BIRD, F.R.C.S.

APOLLINARIS WATER—"The water contained in the glass bottle, doubly charged, is, in my opinion, far superior to the seltzer water supplied to us in England. For dyspeptic, rheumatic, and gouty subjects, I consider it a very valuable beverage, taken either with sherry, brandy, or gin."—G. BORLASE CHILDS, F.R.C.S., Surgeon to the City of London Police.

APOLLINARIS WATER—Dr. Hermann Weber, F.R.C.P., writes:—"Having largely used it during the last seven years, I have found it of great value as an article of diet in gouty dispositions, in lithic acid diathesis, in tendency to gallstones, in some forms of catarrh of the bladder, and in chronic catarrh of the respiratory organs; in the latter, either treated by itself or mixed with hot milk or hot whey. To many persons the Apollinaris forms an agreeable and useful addition to bitter waters, and a good vehicle for some medicines."

APOLLINARIS WATER—"I have personally derived immeasurable advantage from the use of Apollinaris Water, and I have recommended it in my professional capacity very largely to my patients. Its use to myself has been most remarkable, and the testimony of very many to whom I have suggested its use is highly eulogistic of its effect upon them."—GEORGE TATHAM, M.R.C.S., England; L.S.A., J.P., Brighton, formerly Surgeon North Devon Hospital.

APOLLINARIS WATER—"A pleasant beverage, agreeably effervescent, and tenacious of its gas. It is also a very safe and gentle antacid. I hope it will meet the popularity it deserves."—JAMES MORRIS, M.D., London, Fellow of University College.

FOOD IS THE BEST TONIC!!

TRADE MARK.

MENSMAN'S

PEPTONIZED

BEEF TONIC.

The great necessity for a fluid food that would possess all the elements necessary for the support of the system, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared for us by reliable and competant parties after a thoroughly tested and scientific method.

PROPRIETORS,

CASWELL, HAZARD & CO.,

DRUGGISTS AND CHEMISTS,

Fifth Ave., cor. 24th St.; & Sixth Ave., cor. 39th St., New York.

Fluid Extract Guarana.
Fluid Extract Pilocarpus.
Hydrobromic Acid, &c.

SPECIAL NOTICE.

In all cases where it is possible, the Prescriptions and Medicines dispensed at my Pharmacy are compounded from the products of the laboratory of Dr. E. R. SQUIBB, of Brooklyn, thus insuring to both physician and patient Medicines whose purity of quality, and reliability of character, are above suspicion.

Being very desirous of receiving the full confidence of Physicians of this city, I shall ever strive to deserve the same by keeping in my Pharmacy only **Medicines of the Finest Quality and Strictest Purity.** The careful dispensing of Physicians' Prescriptions is the **Leading Feature** of my business.

Physicians in all cases can rely on obtaining, in their Prescriptions, **just what Medicines they Prescribe, and none other,** as no substitution is allowed without first consulting the Physician.

PHYSICIANS CAN ALWAYS FIND AT MY PHARMACY

EVERY SINGLE ARTICLE that is made by Dr. Squibb.
EVERY Gelatine-Coated Pill by McKesson & Robbins.
EVERY Compressed Pill by Wyeth (Philadelphia).
EVERY Dragee by Garnier & Lamoureux (Paris).
EVERY Granulated Salt by Bishop (London).
EVERY Lacto-Peptine Preparation by Reed & Carnrick.
EVERY Variety of London Hospital Throat Lozenges.
EVERY Preparation of Malt by Trommer. Do., Loeflund's

NEW PREPARATIONS PROCURED AS SOON AS INTRODUCED.

For all medicines emanating from my establishment, **I guarantee Absolute Purity, Perfect Freshness, the highest excellence in quality, and the most careful Manipulation in Preparation.**

T. H. SAYRE, Dispensing Chemist, 6th Ave., cor. 46th St., N. Y.

NOTICE.—See our Advertisement, page 8.

Extract of Malt

WITH

COD LIVER OIL.

Our Improved Extract of Malt with 50 per cent of our fine Norwegian Oil, is pre-eminently THE emulsion of Cod Liver Oil, since it *has double the nutritive effect of any other emulsion of oil.* It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that IT UNITES PERFECTLY WITH WATER IN ANY PROPORTION, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

DOSE.—A Dessert to Tablespoonful immediately after Meals.

Prepared with the most scrupulous care

KEASBEY & MATTISON,

MANUFACTURING CHEMISTS,

332 North Front Street, Philadelphia.

☞SEND FOR PAMPHLET ON MALT AND NEW REMEDIES ☜

RIGOLLOT'S PAPER

is not (as certain storekeepers of bad faith pretend) a production that any one can make;

RIGOLLOT'S PAPER

is not manufactured with a mustard that every one can buy;

RIGOLLOT'S PAPER

is one of the most marvelous discoveries of the contemporary pharmacopœia:

RIGOLLOT'S PAPER

is the invention of Mr. P. Rigollot, who is the exclusive owner, and is the only preparation of the kind which obtained a medal and diploma at the Philadelphia Exposition. It is sold wholesale at

No. 24 AVENUE VICTORIA, PARIS.

ALL OTHER MUSTARD LEAVES

which do not bear the signature of P. Rigollot are but IMITATIONS of his remarkable invention, and

SHOULD NOT BE BOUGHT.

RIGOLLOT'S PAPER

is the only one adopted by the Civil and Military Hospitals throughout the whole of Europe.

To be had of all the principal Chemists and drug stores in the world.

INSIST THAT THE SIGNATURE is on each leaf.

P. Rigollot

DR. FRIEDR. WITTE,

Rostock, Mecklenburg,

Begs leave to announce to the profession and drug trade that he has given the sole agency for his goods for the U. S. and Canada to

Mr. F. ALFRED REICHARDT.

I have now a supply of Dr. Witte's goods on hand; they are the most reliable made in Germany, and his preparations of Pepsin, Ptyalin, etc., have taken the first place there *over all others.*

Pepsin, plain, soluble,	1 gr.,	dissolves	100 grs.	of Albumen,	*Per doz.*,	$1 25
Ptyalin,	1 "	"	100 "	Boiled Starch,	"	1 25
Ptyalin Pepsin,	1 "	"	100 "	" "	"	1 25
	and		100 "	Fibrin,	"	
Resin, Scammony from Root, powd.,					*Per oz.*,	60c.
Extr. Cannabis Indic, superior to English, 2 oz. jars,						85c.
" Colocynth, simple (imported to make Ex. Coloc. Comp.),						60c.
" Taraxaci, in 1 lb. porcel. jars,						80c.
" Ferri Pomate, " " " "						$1 00

Prices inclusive of jars and bottles.

MATHIAS ROZSNYAY,

Arad, Hungary,

Begs leave to inform the Medical Profession that he has given his sole agency and the exclusive control of his preparation of

TASTELESS QUININE,

Neutral Tannate of Quinine,

To Mr. F. ALFRED REICHARDT, who keeps full stock of his preparations.

The discovery of Mr. Math. Rozsnyay to make an *absolutely tasteless and reliable* preparation of Quinine is one of the most important in modern therapeutics. The ordinary Tannate of Quinine, as made in chemical works, is obtained by precipitating the mother liquor, of which Quin. Sulphate has crystallized out, by an addition of Tannic Acid. First, this is an acid or bi-tannate, and contains likewise all the other Cinchona Alkaloids, Quinidia, Cinchonidia, Cinchona, Quinicidin, etc., the little intrinsic value of which is best proven by the price lists of large German manufacturers who quote this salt at only one-sixth of the value of the Sulphate. The *neutral* Tannate of Quinia has also great advantages over the Sulphate, as it does not cause the same cerebral and digestive troubles, as has been fully proved by the report of the commission appointed by the Academie de Medicine, in Paris, on a memoir presented by Mr. Bonesiere. The commission consists of Messrs. Orfila, Bussy & Bouvier; their names are sufficient proof for the thoroughness of their researches.

I guarantee that this Neutral Tannate contains in 2½ grains the same percentage of pure Quinine as is contained in 1 grain of the Sulphate, and that its effects in equivalent doses are the same as that of the Sulphate. In treatment of diseases of children and persons of delicate taste, it is of the highest value. It is also put up in Chocolate Lozenges, containing each 2½ grs. of Tannate, 2 doz. in a box. Pamphlet sent free on application. Price per box, $1.00. Per ounce, $3.00.

FRANCIS J. GEIS,

Brewer and Maltster, Dobbs' Ferry, N. Y.,

PURE EXTRACT OF MALT.

Sole Agent for the U. S. and Canada, F. ALFRED REICHARDT.

This extract is absolutely pure and superior to **any other** make, foreign or domestic. Made without addition of hops, glucon, and guaranteed to be free from any substance whatsoever foreign to the best barley malt and distilled water. It is also the *cheapest* in the market. Put up in neat 1 lb. jars at 50c. per jar, or $3.75 per gallon, jar inclusive.

F. ALFRED REICHARDT,

Late Helmick, and Helmick & Co.,

Fluid Extract of Damiana.

The most effective preparation made under this name. It is a very efficient uterine tonic of the highest value in Impotency, Prostatitis, Spermatorrhœa, Suppressed Menses, and Catarrh of the Bladder. Its tonic action is as certain as that of Quinine. Put up in bottles of 6 oz. $2.00 per bottle. $16.00 per doz. Pamphlet sent gratis on application.

NITRITE OF AMYL PEARLS.

Made from Dr. E. Squibbs' Nitrite of Amyl. The only ones in the market of correct dosage. 2 and 3 drop, 75c. per doz. 5, 8 and 10 drop, $1.00 per doz.

IODOFORM, CRAYON'S.

Dr. Leblond's formula for Ulcerations of the Cervix. $1.00 per doz.

APIOL CAPSULES,

Absolutely pure. Containing 6 drops. The *only pure* of domestic make. $5.00 per 100.

BRUSH-HOLDING RUBBER STOPPLES.

90c. per doz.

F. ALFRED REICHARDT, Pharmacist and Importer, 404 Fourth Ave., N. Y.

A FEW FACTS.

It is generally conceded, that, although the Drug Stores are usually well supplied with numerous styles of Enema Syringes, yet, it has heretofore been impossible for Physicians, or those requiring instruments of this kind, to obtain a really first-class Syringe; although exorbitant prices have been paid for several of the more prominent bulb Syringes, simply because the patents of certain manufacturers, were supposed to grant an entire monopoly, in the manufacture of this article.

When we consider the very just prejudice against lead pipes, for conveying or holding a liquid intended to be taken into the system, it seems strange, that an instrument so exceedingly useful as the Syringe, should have been heretofore made with Lead pipes and attachments; simply brushed over the polished surface, with a thin Alcoholic Varnish, or "*Laquer*," to prevent them from tarnishing, until sold or used. A prominent Physician recently remarked, "that he would as soon think of wearing artificial teeth made with lead or britannia plates, as to recommend a metallic Syringe subject to the same poisonous corrosion."

Therefore we arrive at the fact, that a Syringe should not only be mechanically perfect in its construction and action, but the tubes and attachments, should certainly be made of either Gold, Hard Rubber, Platina or Nickel.

Dr. De Henrie's **"Gold Favorite"** and **Nickel Plated** Syringes, answer all these requirements.

A GOLD SYRINGE,

The constantly increasing favor with which the medical faculty and the public have received DR. DE HENRIE'S improved Nickel plated Syringes, has induced us to introduce a new and valuable novelty in Bulb Syringes to which the attention of physicians and the trade is respectfully solicited. "DE HENRIE'S GOLD FAVORITE" is certainly the most elegant syringe yet manufactured. The metal attachments are made of the purest white metal and nickel, heavily plated with 24 *carat gold*. This substantial plating extends throughout the inside of the tubes, and renders the syringe as pure and valuable for all practicable purposes as though the parts were solid gold. We wish it clearly understood that the "Gold Favorite" is not merely gilded, but substantially plated with pure gold, done in our own factory under the personal supervision of our Mr. Sutton. The rubber bulb and tubing is the finest made, and will not become hard or lose its elasticity, purity and durability being the object obtained.

The "Favorite Syringes," whether gold or nickel-plated are a decided improvement over those made with two elastic tubes extending from each end of the bulb, as the "Favorite" possesses all the merits claimed for a bulb held horizontally, while the valves work vertically which insures a perfect and easy action of the Syringe.

The rigid inlet pipe is conveniently held in the fluid to be injected; operating as a hand-rest, a great convenience to invalids.

De Henrie's "GOLD FAVORITE" Syringes are warranted perfect in every respect, and are justly entitled to rank as the *leading instrument*" among Syringes both in this country and abroad

The "GOLD FAVORITES" are all furnished in our patent polished walnut cases, lined with silk velvet, and are sold by leading druggists throughout the world.

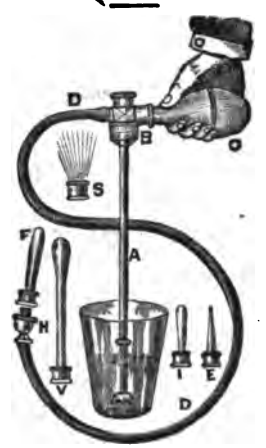
Wholesale price, $30,00 per dozen.

Dr. DeHenrie's Favorite Syringe.

Practical experience, and an earnest desire to overcome the many faults found in the construction and operation of the syringes heretofore sold, resulted in the invention of the "FAVORITE" which was introduced to the trade in April, 1877. It immediately became, as the name implies, a "Favorite" with the profession and the public, being ordered by the United States Government for use in the medical department of the United States army, and receiving the endorsement and praise of the highest medical authorities both here and in France, while the sales have been unprecedented This Syringe was introduced for favor entirely upon *its own merits*, and has achieved these results simply because of the following points of superiority. It possesses all the merits of a syringe with two elastic tubes—that of drawing liquid from a deep vessel, and the convenience of operating the bulb horizontally, while the *serious objections* to syringes of this style, such as the difficulty of keeping the rubber inlet-tube in the fluid (particularly when it becomes bent to the shape of the box), and the absence of a hand-rest making it fatiguing to pump with an extended hand, are all overcome in the FAVORITE, as the rigid suction pipe maintains a perpendicular position in the fluid, and can be easily handled, while it serves as a hand-rest, a comfort to ladies and feeble persons. As the outlet valve is located at the end of the elastic tube (*not at the bulb*), the fecalised fluids from the rectum are prevented from passing into the rubber tube, therefore it cannot become offensive. The valves work vertically, and are carefully fitted, so that every valve works snug and true, and are not liable to clog or get out of order. The bulb discharges the fluid in a direct line with the discharge pipe; being the only syringe having this valuable improvement of a bulb operating horizontally at right angles to the inlet tube, thus making it the easiest syringe known for an invalid to operate, never tiring the hand; while the old style, having the bulb standing upright on top of the suction pipe, must necessarily require more exertion, as the fluid is pressed against the valve and forced around an acute angle, requiring strength to operate it. One trial of De Henrie's Syringe is convincing that it is the best to recommend to an invalid or to ladies.

De Henrie's Favorite is elegantly NICKEL PLATED; making the metallic parts pure as glass for use. Each syringe is packed in a handsome polished walnut case, fitted with compartments for each part. As a syringe for family use it has no equal, being composed of tubes for the injection of male adult, female vagina, children, eye, ear, and a spray for inflamed surfaces. Wholesale price, $12.00 per dozen.

Explanation of Dr. De Henrie's Improved Favorite Syringe.



A—Suction Pipe, with Valve at **B**. **C**—Rubber Bulb, connects with A at **B**. **D**—Flexible Tube of the Finest Rubber. **H**—Outlet Valve Chamber. **F**—Injection Tube for Bowels of Adults or Children. **V**—Vaginal or Female Tube. **I**—Infant Tube, **E**—Ear Tube. **S**—Spray Cap for the Eye or inflamed Surface.

All enclosed in elegant, polished Walnut Boxes fitted with our patent compartments for keeping the tubes in place, and prevent them from rattling when carried.

The metalic parts are thickly plated with Gold or pure Nickel. The Rubber Bulb and Tubing is the *finest made*. The action is easy, and the valves fit perfectly, therefore the Syringe injects no air.

THE DE HENRIE SIPHON.

P, Spiral Coil, prevents the rubber tube from slipping out of the vessel; **B**, small rubber bulb, one compression starts the flow; **S**, improved stop cock; **F**, male tube; **V**, Vagina or Female Tube; **E**, Ear Tube; **N**, Nasal Douche; **A** Spray for inflamed surfaces.

This already famous Syringe is conceded by physicians to be the most convenient and useful article yet introduced; our cut is a fair illustration of its actual merits.

It acts automatically, dispensing with the pumping attendant upon the use of Bulb Syringes, and is designed as a decided improvement on the well-known water bag or "Fountain Syringe." In this Syringe we dispense with the rubber bag, which is so liable to crack or become leaky, and instead we use any convenient vessel for holding the liquid to be injected, simply placing the vessel upon the washstand bureau or mantel or suspended above the head, for injecting any quantity of fluid, from an ounce upward. A single compression of the small bulb **B** (see cut) starts the flow which continues whenever the stop-cock **S** is open. The hydrostatic pressure is invariably sufficient for vaginalor ordinary injections of the rectum or bowels, or a slight compression of the bulb increases the force when necessary to remove hardened feces from the rectum. As a nasal douche it has no equal. Each syringe complete with tube for male, female and infant, ear, nasal tube, and sprinkler. The metalic parts are manufactured of the purest white Britannia. nickel plated, all enclosed in a polished patent walnut case.

Wholesale Price, $15 per dozen.

MACDONALD & SUTTON,
GOODYEAR INDIA RUBBER GOODS,
299 Broadway, N.Y. 12 Rue Monsigny, Paris.
Ludwigs hafen a Rhine, Germany.

TO PHYSICIANS.
THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving resules of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

WANTED—A COMPETENT PHYSICIAN.... 4

LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.

The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the ***Medical Department of the United States Army.***

IOWA STATE UNIVERSITY,
IOWA CITY, IOWA.

MEDICAL DEPARTMENT.—SESSION OF 1877-'78.

The next regular course will commence on Wednesday, October 24th, 1877, and continue until the first Wednesday in March, 1878. The preliminary term will begin on Wednesday, October 10th, and continue until the opening of the regular course. Clinical instruction in Mercy Hospital gratuitous. Advanced students will be intrusted with the care of cases. Applicants for graduation will be required to perform operations upon the cadaver. An abundant supply of dissecting material constantly on hand.

FEES.—For the entire Course, $20.00. Matriculation Ticket, $5.00. Demonstrator's Ticket, $5.00. Graduation Fee, $25.00. For further information, address W. P. PECK, M.D., Dean, Davenport, Iowa,
Or, ELMER F. CLAPP, M.D., Sec'y, Iowa City, Iowa.

N. H. MEDICAL INSTITUTION AT
DARTMOUTH COLLEGE.

The *Eighty-second* Annual Course of Lectures begins Aug. 1, 1878, and continues fourteen weeks. Recitations from Dec. 5 to June 20.

FACULTY:—E. R. Phelps, M.D., LL.D., Practice Emeritus; A. Smith, M.D., LL.D., Therapeutics Emeritus; O. P. Hubbard, M.D., LL.D., Chemistry; E. R. Peaslee, M.D., LL.D., Gynecology; J. Ordronaux, M.D., LL.D., Medical Jurisprudence; C. P. Frost, M.D., Practice; P. S. Conner, M.D., Surgery; E. S. Dunster, M.D., Obstetrics; H. M. Field, M.D., Therapeutics; L. B. How, M.D., Anatomy and Physiology.

FEES:—Matriculation, $5; Lectures, $77; Graduation, $25; Recitations, $40.

For Circular, address C. P. FROST, M.D., Dean, Hanover, N. H.

MEDICAL DEPARTMENT OF
HARVARD UNIVERSITY,
BOSTON, MASS.

NINETY-FOURTH ANNUAL ANNOUNCEMENT. (1877-'78.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 27th, 1877, and ends the last Wednesday in June, 1878. Persons who hold no degree in arts or science must hereafter pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 24th.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing

DR. R. H. FITZ, Secretary, 108 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF
YALE COLLEGE.

Spring Term begins March 1, and closes June 28, 1877.

Winter Term begins October 4, 1877; closes January 31, 1878.

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $60.00. Graduation Fee, $20.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $5.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing

H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar.

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1877, and continue twenty-one weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

WM. H. BYFORD, A.M., M.D., President.

THIRD REVISED AND ENLARGED EDITION.

In one handsome volume.

Price, - - - - $3.00

WM. WOOD & CO., Publishers, 27 Great Jones St., N.Y.

Sent to Subscribers of The Medical Record for $4.00 a Year

ANNOUNCEMENT.

An increase of 200 pages additional Reading Matter in a year will be made in

THE AMERICAN JOURNAL OF OBSTETRICS

And Diseases of Women and Children.

PAUL F. MUNDÉ, M.D., Editor.

In consequence of the great increase in the number of subscribers to the AMERICAN JOURNAL OF OBSTETRICS the past year or two, the Publishers take pleasure in announcing that, beginning with January, 1878 (Vol. XI., No. 1.), they will permanently increase each number by *fifty additional pages*, thus giving its subscribers annually about

ONE-THIRD MORE READING MATTER

than heretofore, or, a volume of 896 large octavo pages with *no change in the subscription price.*

An increased number of illustrations, both wood engravings and lithographed plates, may also be expected in future volumes.

While the prosperity of the AMERICAN JOURNAL OF OBSTETRICS, and this consequent substantial evidence of it, cannot fail to be gratifying to all its subscribers and other friends, the Publishers trust the Medical Profession will take this voluntary action on their part as an earnest of their desire and intention, so far as in their power, to make all their publications merit the liberal support which is given them.

Subscription Price, $5.00 per year, invariably in advance.

☞If any subscriber has a friend to whose notice he would like to commend the Journal, the Publishers will be pleased to mail a Specimen Copy to any address furnished them.

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

THE NEW MODEL PHYSICIAN'S MICROSCOPE,

Manufactured by the BAUSCH & LOMB OPTICAL CO.,

Under the direct supervision of MR. GUNDLACH.

While elegant in design, it is low and compact, a great advantage for medical and histological purposes The Stage is large and firm, resting on two strong brass arms. The mirror has a very wide range of motion for oblique light, and may be brought above the Stage for the illumination of opaque objects. There is a Sub-Stage, with Diaphragms, which may be placed close to the object or at some distance below it, as the microscopist may wish. Draw tube for increasing power.

The Coarse Adjustment is by rack and pinion, of the best workmanship, and the Fine Movement is by Mr. Gundlach's new device, which has given universal satisfaction.

The Optical Part is of the best quality, and has been specially designed for histological and medical purposes. There are two Eye-pieces, A and C; two Objectives, 3-4 and 1-5, giving eight magnifying powers, ranging from 50 to 375 diameters—sufficient for all ordinary work. There is also a Camera Lucida for drawing, and an eye-piece micrometer with scale and rules for accurate measurement.

PRICE, in Neat Black Walnut Case, with Drawer for Accessories, Lock, Key and Handle, $60.00.

INDUSTRIAL PUB. CO., 176 Broadway, N. Y.

Medical Thermometry and Human Temperature. By EDWARD SEGUIN, M.D. In one octavo volume of 470 pages, with numerous diagrams. Extra muslin. Price $3.50,

Rhinoscopy and Laryngoscopy: their Value in Practical Medicine. By Dr. FREDERICK SEMELEDER, Member of the Royal Medical Society of Vienna, etc. Translated from the German by EDWARD T. CASWELL, M.D. With Woodcuts and two Chromo-lithographic Plates. In one handsome octavo volume, bound in muslin. Price $3.25.

Pathological Anatomy of the Female Sexual Organs. By JULIUS M. KLOB, M.D., Professor at the University of Vienna. Translated from the German by JOSEPH KAMERER, M.D., and BENJAMIN F. DAWSON, M.D. Vol. I.—Affections of the Uterus. In one handsome octavo volume, bound in muslin. Price $3.50.

A Practical Treatise on Bright's Diseases of the Kidneys. By T. GRAINGER STEWART, M.D., F.R.S.E., Fellow of the College of Physicians, Lecturer on General Pathology, Surgeon's Hall. Illustrated with seven lithographed plates (one colored). In octavo volume, bound in cloth. Price $4.50.

A Treatise on the Diseases of the Eye, Including the Anatomy of the Organ. By CARL STELLWAG VON CARION, M.D., Professor of Ophthalmology in the Imperial University of Vienna. Translated from the German, and Edited by D. B. ST. JOHN ROOSA, M.D.; CHAS. S. BULL, M.D.; and CHARLES E. HACKLEY, M.D. Illustrated Wood Engravings, and Chromo-Lithographs. In one large large octavo volume. Price, handsomely bound in muslin, $7.00; leather, $8.00.

Micro-Chemistry of Poisons, including their Physiological, Pathological, and Legal Relations: adapted to the use of the Medical Jurist, Physician, and General Chemist. By THEODORE WORMLEY, M.D., Professor of Chemistry and Toxicology in Starling Medical College, etc. With seventy-eight illustrations on steel. In one 8vo volume, bound in muslin. Price $10.00.

Dental Pathology and Surgery. By JAMES A. SALTER, M.B., F.R.S. In one handsome octavo volume, with one hundred and thirty-three engravings. Bound in satin finish muslin. Price $4.50.

Idiocy: and its Treatment by the Physiological Method. By EDWARD SEGUIN, M.D. In one handsome octavo volume of 457 pages, neatly bound in muslin. Price $5.00.

Sent by mail, post-paid, on receipt of price.

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is generally preferred; or of an **elixir**, when a slight stimulant is desired.

Durel's Syrup of Tar and Iron.

Prepared by DUREL, Pharmacist, Paris.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron, is a desideratum which has at last been attained in this preparation. The indications for such a remedy are many, but it has been found especially useful in *Chlorosis, Bronchial Catarrh, Catarrh of the Bladder, Chronic Uterine Discharges*, depending upon an enfeebled or relaxed state of the system.

It is sold by chemists generally.

E. FOUGERA & CO.'S

MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of **Ether; Chloroform; Oil of Turpentine; Apiol;**
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

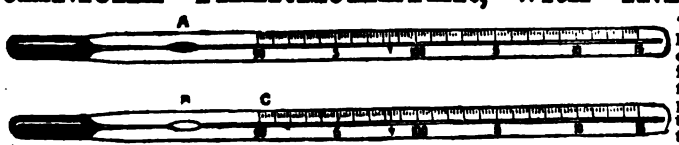
Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Pharmacien, No. 40 Rue Bonaparte, Paris, without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $7 00

We also offer:

No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 5 00

No. 1. Casella's Clinical Thermometer for Hospital use, four or six inch, in neat pocket case..... 3 50

Sent free by mail on receipt of price. Manufactured by L. CASELLA, London.

E. FOUGERA & CO., Agents, 30 North William St.. New York.

THE BOSTON

MEDICAL AND SURGICAL JOURNAL

ESTABLISHED 1828.—PUBLISHED WEEKLY.

The Publishers of The Boston Medical and Surgical Journal wish to call the attention of physicians to certain special features of this journal which make it exceptionally valuable as a medical periodical, and which commend it to the favor of professional gentlemen throughout the United States.

1. It is a weekly publication, thus possessing obvious advantages for the prompt presentation of medical intelligence, a great part of whose value lies in its freshness.

2. Being the only medical publication in New England, it possesses unusual opportunities for obtaining contributions to its pages, and is able to combine the special advantages of both a weekly and a monthly journal.

3. It contains *nothing* but original material. There are no borrowed articles, the current literature of the day being represented, in a manner peculiar to this journal, by a series of reports by experts in special departments of medical science, who give comprehensive and critical summaries of the most recent advances in their respective branches, and who constitute undoubtedly the strongest corps of the kind in the country.

4. It gives special attention to the department of reviews, which are fuller and more carefully prepared than in most medical journals.

5. Reports are received from a large number of medical societies, representing all departments of medicine. The facilities for obtaining clinical contributions from hospital practice have been greatly enlarged, embracing the most important hospitals of New England.

6. The correspondents' department has been organized with great care, and the chief medical centres of the world are here represented. A letter from one of these places appears in each issue of the Journal.

7. A weekly table, showing the comparative mortality rates for the week, of thirteen large cities in the United States

8. Editorially the Journal aims to represent the profession of the whole country. It is one of the pioneers of medical science in the country, being, with one exception, the oldest now in existence. It was originated and has been maintained by no school or interest whatever beyond that of the science and practice of medicine and the medical profession.

The Editors and Publishers will spare no pains to keep the Journal in the high and honorable position which it has so long occupied among American medical periodicals.

Editor.—Dr. J. COLLINS WARREN.

Editorial Staff.—Dr. A. D. MASON, Dr. C. F. FOLSOM, Dr. GEORGE B. SHATTUCK.

Editorial Reporters.—Dr. G. W. GAY, Dr. F. W. GOSS, Dr. HAMILTON OSGOOD.
Dr. H. P. QUINCY, Anatomical Draughtsman.

The Reporters on Medical Progress in Anatomy, Chemistry, Dentistry, Dermatology, Diseases of Children, Diseases of the Throat and Chest, Electro-Therapeutics, Gynecology, Materia Medica, Mental Diseases, Military Surgery, Obstetrics, Ophthalmology, Orthopedic Surgery, Otology, Pathology, Physiology, Public Hygiene and Forensic Medicine, Surgery, Syphilis, Theory and Practice of Medicine, and Genito-Urinary Surgery, comprise the principal Professors in the Medical School of Harvard University, and the leading Physicians and Surgeons in the Massachusetts General Hospital, Boston City Hospital, and Boston Lying-in Hospital.

TERMS.—*Five dollars a year*, payable in advance; single numbers *fifteen cents*. *Postage in all cases is paid by the Publishers.* Remittances may be made by draft, money-order, or registered letter to H. O. Houghton & Co., *Riverside Press, Cambridge, Mass.*

A Compend of Diagnosis in Pathological Anatomy

With Directions for Making Post Mortem Examinations. By Dr. Johannes Orth. Translated by G. K. Sabine, M.D., and F. C. Shattuck, M.D. Revised by R. H. Fitz, M.D. In one volume, 8vo, cloth, $3.50.

In issuing a translation of this recent German work, the publishers have been convinced of its great practical value to all medical students. The directions for making an autopsy are given with great thoroughness and precision; the means of recognizing the various changes which may be found on the different parts of the body are briefly stated in a systematic manner, and the medico-legal bearing of the results of the investigation are always carefully attended to. The description of the gross appearances is also supplemented by thoroughly practical directions in the use of the microscope, when important additional information becomes necessary for exact diagnosis.

Dr. Orth was formerly the assistant of Professor Rindfleisch, and at present holds a like position under Professor Virchow. The teaching which he offers is consequently that of the highest authorities in the very centre of modern investigation in this department of medicine.

The Publishers are the more desirous of calling attention to the translation, as it contains, through the kindness of the author, much additional information and corrections as he has prepared for the second edition of the original work, hereafter to be published. They have received many letters from prominent physicians and surgeons, warmly commending the book, and among them the following:

College of Medicine, Syracuse University,
Syracuse, N. Y., *December* 5, 1877.

Every physician should carefully read the admirable work of Prof. Orth on "Diagnosis in Pathological Anatomy." For this book teaches —what so few know—how to make a neat *sectio cadaveris*. Prepared by a pupil of Virchow, the greatest pathologist in the world, it is not only fascinating, but authoritative on all points which it discusses. Cleverly translated, the book is one of the best additions to the best recent medical literature. I thank you for the copy sent me. I heartily commend it to my classes, and to my professional brethren here and everywhere.

H. D. DIDAMA.

Philadelphia, *December* 7, 1877.

I have delayed the acknowledgment of the handsome translation of Orth's "Diagnosis in Pathological Anatomy," which you so kindly sent me, until I had time to read it carefully. Its clear and brief, but comprehensive, descriptions of the downright facts of pathology are almost unsurpassed, and although I am at present teaching normal histology, I shall have and use many opportunities of recommending this work to our students.

JOS. G. RICHARDSON.

Professor of Dermatology.

A. E. MACDONALD, M.D.,
Professor of Medical Jurisprudence.

JOSEPH W. HOWE, M.D.,
Clinical Professor of Surgery.

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 19, 1877, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Third of October, 1877, and end about the 1st of March, 1878.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals, with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted to *all the Clinics* given therein, *free of charge.*

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Demonstrator's fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	30 00

For further particulars and circulars, address the Dean,

Prof. CHAS. INSLEE PARDEE, M.D.,

University Medical College, 410 East 26th St., New York City.

UNIVERSITY OF VERMONT.

MEDICAL DEPARTMENT,

BURLINGTON, VT.

TWENTY-FIFTH SESSION, 1878.

FACULTY OF MEDICINE.

MATTHEW HENRY BUCKHAM, A.M., D.D., BURLINGTON, VT., President.
SAMUEL WHITE THAYER, M.D., LL.D., BURLINGTON, VT., Emeritus Professor of General and Special Anatomy; Consulting Surgeon to Mary Fletcher Hospital.
WALTER CARPENTER, M.D., BURLINGTON, VT., Professor of the Theory and Practice of Medicine; Physician-in-Chief to Mary Fletcher Hospital.
JOHN ORDRONAUX, M.D., LL.D., NEW YORK CITY, Emeritus Professor of Medical Jurisprudence.
WILLIAM DARLING, A.M., M.D., F.R.C.S., NEW YORK CITY, Professor of General and Special Anatomy.
A. F. A. KING, M.D., WASHINGTON, D. C., Professor of Obstetrics and Diseases of Women; Consulting Physician to Mary Fletcher Hospital.
HENRY D. HOLTON, M.D., BRATTLEBORO, VT., Professor of Materia Medica and General Pathology; Consulting Surgeon to Mary Fletcher Hospital.
MARSHALL CALKINS, A.M., M.D., SPRINGFIELD, MASS., Professor of Physiology and Microscopic Anatomy.
JAMES L. LITTLE, M.D., NEW YORK CITY, Professor of the Principles and Practice of Surgery; Surgeon-in-Chief to Mary Fletcher Hospital.
GEORGE S. SMYTH, Ph.D., University Professor of Chemistry and Toxicology.

PROFESSORS OF SPECIAL SUBJECTS.

WILLIAM A. HAMMOND, M.D., NEW YORK CITY, Professor of Diseases of the Mind and Nervous System.
ROBERT W. TAYLOR, M.D., NEW YORK CITY, Professor of Diseases of the Skin.
A. P. GRINNELL, M.D., BURLINGTON, VT., Professor of Diseases of the Heart and Lungs; Attending Physician to Mary Fletcher Hospital.
STEPHEN M. ROBERTS, M.D., NEW YORK CITY, Professor of Diseases of Children.
A. T. WOODWARD, M.D., BRANDON, VT., Professor of the Surgical Diseases of Women; Consulting Physician to Mary Fletcher Hospital.
EDWARD S. PECK, A.M., M.D., BURLINGTON, VT., Professor of Diseases of the Eye and Ear.

LEROY M. BINGHAM, M.D., BURLINGTON, VT., Demonstrator of Anatomy; Attending Surgeon to Mary Fletcher Hospital.

THIS Medical College is situated near the University buildings, and upon an eminence overlooking the city of Burlington, Lake Champlain, and the Adirondack chain of mountains. For beauty of scenery and salubrity of climate its situation is not surpassed by any Institution of learning in the country. The building is of brick, well ventilated, and provided with two commodious lecture-rooms and amphitheatre, two large well lighted dissecting-rooms, and in every way perfectly adapted for clinical and scholastic teaching. It contains a large museum, composed of a great number of Osteological and Vascular preparations, both wet and dry, and is open to the students during the session.

HOSPITAL ADVANTAGES. The Mary Fletcher Hospital, now in progress of erection, will probably be ready to receive patients before the next regular session.

Clinical instruction in Medicine, Obstetrics, and Surgery, will be given during the regular course of lectures, by the Professors of the Medical Department of the University.

THE REGULAR WINTER SESSION will commence on the first Thursday of March, 1878, and continue sixteen weeks. This course will consist of from five to six Lectures daily, in the various Departments of Medicine and Surgery.

In order to render the course of instruction still more complete, six new Professorships on special subjects have been created by the Faculty since the close of the last session, which will afford the student a rare opportunity for gaining information from gentlemen well known as recognized authorities in their particular departments on subjects of great practical interest. These lectures will be delivered during the regular session.

CLINIQUES. Besides these Lectures, there will be Cliniques held as follows:

SURGICAL CLINIQUE, by Prof. LITTLE, every Saturday, from 9 to 12, during the last half of the Session.
MEDICAL CLINIQUE, by Prof. CARPENTER, on Wednesday morning, during the first half of the term.
CLINIQUE FOR DISEASES OF EYE AND EAR, by Prof. PECK, during his course of Lectures
CLINIQUE FOR DISEASES OF SKIN, by Prof. TAYLOR, during his course.
CLINIQUE FOR DISEASES OF CHILDREN, by Prof. ROBERTS.
CLINIQUE FOR DISEASES OF NERVOUS SYSTEM, by Prof HAMMOND, during his course of Lectures.

FEES FOR THE REGULAR SESSION.

Matriculation Fee, Payable each Term,	$5.00
Fees for the full Course of Lectures by all the Professors,	70.00
Graduation Fee,	25.00

Material for dissection will be furnished at cost.

The tickets are to be taken out at the beginning of the Session.

Students who have already attended two full courses of lectures in other regular schools, are admitted on paying the Matriculation fee and $25.

Students who have attended two full courses in this College, or who, having attended one full course in some regularly established medical school and one full course in this College, are admitted to a third course of lectures on paying the matriculation fee only.

GRADUATES of this school are admitted without fee. GRADUATES of other regular schools, and *Theological Students*, are admitted on general ticket, by paying the matriculation fee.

Good Board can be obtained at reasonable rates.

For further particulars and circular, apply to the Secretary,

Prof. A. P. GRINNELL, M.D., Burlington, Vt.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMYTH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

McKESSON & ROBBINS' GRANULES, Gelatine-Coated.

Aconitia	1-60 gr.	**Mercury, Proto-Iodide**	1-5, 1-4, 1-2 gr.
Arsenious Acid	1-50, 1-40, 1-30, 1-20 gr.	**Morphia, Acetate**	1-8, 1-4 gr.
Atropia	1-60 gr.	**Morphia, Sulphate**	1-16, 1-10, 1-8, 1-6, 1-4 gr.
Belladonna Extract	1-4 gr.	**Morphia, Valerianate**	1-8 gr.
Calcium, Sulphide	1-10 gr.	**Podophyllin**	1-8, 1-4 gr.
Codeia	1-16, 1-5 gr.	**Quinia**	1-2, 1-4 gr.
Corrosive Sublimate	1-40, 1-30, 1-20 gr.	**Strychnia**	1-60, 1-40, 1-30 gr.
Digitalia	1-60 gr.	**Sulphur, Iodide**	1-25, 1-10 gr.
This is prepared in our own laboratory and can be confidently relied upon.		**Tartar Emetic**	1-100, 1-20, 1-4 gr.
Mercury, Bin-Iodide	1-25, 1-16 gr.	**Zinc, Phosphide**	1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

Quote MEDICAL RECORD.

GARNIER, LAMOUREUX & CIE.,

213 RUE ST. HONORÉ, PARIS,

Beg leave to inform the profession that Mr. F. ALFRED REICHARDT, 404 Fourth Avenue, N. Y., is their Sole Agent, and keeps a full stock of their Sugar-Coated Pills and other goods on hand.

Referring to above, I beg leave to call the attention of the profession to the goods made by Messrs G., L. & Co., of Paris. They are the first house which made Sugar-Coated Pills a specialty, and their goods were introduced twenty-five years ago into the United States. Their goods are superior in finish and quality to any other made. They use no coating between pill mass and sugar, and all their pill masses are easily soluble. **Their list prices to physicians are lower than other makers,** and their goods more reliable.

The latest additions to their list are: Dragees of Crystal. Valerianate of Ammonia, without taste or smell, 2 grains; Citrate of Coffeia, ½ grain; Monobromide of Camphor, 2½ grains; Codeia, 1-6 grain; Crotors Chloral (Liebreich's), 2½ grains; Cynoglosse or Pil. Nepenthe; Diascardium; Extract Eucalyptus, 2½ grains; Malate or Pomate of Iron; do., with ¼ grain Extr. Nux Vomica; Extr. Gilsemium; Drag. Meglin; Quin. and Ferri Citras, (20% Quins.) 2 grains; Tonic Aperient; also the already well-known Granil Proto-Iodide Mercury, 1-5 grain, and Dr. Francis' Triplex Pills.

Goods sent free by mail on receipt of list price. Please send for Price List and Descriptive Pamphlet, mailed free on application.

Original Communications.

A CLINICAL ACCOUNT OF SOME CASES OF INTRA-LARYNGEAL GROWTHS.

By GEORGE M. LEFFERTS, M.D.,

CLINICAL PROFESSOR OF LARYNGOSCOPY AND DISEASES OF THE THROAT, COLLEGE OF PHYSICIANS AND SURGEONS; LARYNGOSCOPIC SURGEON TO ST. LUKE'S HOSPITAL, ETC.

I PRESENT the following cases as illustrations of a most interesting and I am sure, as far as results go, most important department of laryngeal pathology; likewise as examples of what may be effected in treatment by the natural passages and through the aid of the laryngoscope. I desire still further to call attention, purely for scientific reasons, to the fact that in the majority of the cases, I am not sure but in all, no laryngoscopic examination had been made previously to mine, though all of them had been under professional care, and the symptoms were such, as the reader may judge, as to certainly direct attention to the larynx as the seat of the malady. This being the case, I may be pardoned if I ask the careful consideration of those who apparently do not as yet appreciate the value of the laryngoscope as a diagnostic means, simply I believe because a lack of familiarity with its use has not *demonstrated* to them its worth, to the fact that its use is not very difficult to acquire with some practice, and to assure them that the importance and interest of the *practical* results which it affords—to say nothing of the satisfaction which one must feel at having added to his diagnostic and therapeutic resources an aid which he will in certain instances find not only very valuable, but often indispensable, will most richly repay for any time and labor expended in acquiring the necessary amount of technical skill.

I would, moreover, refer them to the *results* of experience in the practical use of the instrument as embodied in the literature of the day, and request that it be contrasted with such statements as the following—statements made with an honest and thorough conviction as to their truth—by no mean authorities *in their time.*

In speaking of laryngeal growths, one says, "From the infrequency of their occurrence, and the undistinguishing character of the symptoms they give rise to, they generally remain undetected till after death;" * and another, "Perhaps there is no class of diseases involved in greater obscurity or presenting greater difficulty to the practitioner than those affecting the larynx and trachea . . . and, by reason of the difficulty of the subject, it will be long before the same accuracy of information, with reference to the affections of the windpipe, can be attained that is possessed in other diseases." †

Comment is hardly necessary. Is not the fact to-day proven to every unprejudiced mind that our ideas concerning the pathology, physiology, and therapeutics of this very important organ have undergone a wonderful revolution in a comparatively few years. Do we not now possess the "accuracy of information," or at least the means of acquiring it, for the larynx is no longer a *terra incognita;* light has literally been thrown upon it and upon its morbid conditions by the laryngoscope, and their diagnosis rendered accurate, their treatment in the great majority of instances safe and effectual.

CASE I.—March 3, 1875, I was consulted by Mrs. T. in relation to a complete aphonia from which she had suffered for some six months. I was informed that during the previous July she had noticed a slight hoarseness, which was attributed to exposure, and supposed would soon pass away without treatment, especially as her voice had always been previously perfect; but the condition persisting throughout August and September, various treatments, internal and external, were pursued without any alleviation of the progressive hoarseness. The laryngoscope was not used.

In October the voice was totally lost, and the respiration affected. This interference with respiration does not seem to have been very marked, consisting alone in a certain sense of oppression and some shortness of breath after exertion, without being progressive. In addition, she has suffered from numerous attacks of laryngeal spasm, always occurring in the night, and being of varying degrees of intensity. Conversation is carried on in a feeble, strained whisper, barely audible at a short distance, which causes marked fatigue if protracted beyond a few moments, associated with a dull pain over the larynx and chest. Her general condition is good, and she tells me that her health has not been in the slightest degree affected by the above-described conditions; indeed, she weighs more now than she did some six months since.

The objective examination gives the following results: the respiratory murmur is everywhere good over both lungs, its pitch alone being modified by the stridulous sound transmitted into the bronchiæ from the larynx. The laryngoscope shows that the whole anterior commissure of the larynx is filled up by a large, smooth, ovoid growth, fibro-cellular or fibroid in its nature. It is tolerably well pictured in the

drawing. It extends backwards until it occupies about one-half of the antero-posterior diameter of the laryngeal cavity, and terminates in two large rounded points. It has its points of attachment in the commissure and upon the superior surface of the left vocal cord anteriorly. As is seen, it occupies very completely the greater part of the glottic opening, and most effectually prevents the process of phonation by holding the vocal cords apart.

On March 8th an attempt was made to remove the neoplasm with a Mackenzie's laryngeal forceps, which failed mainly because the forceps were too large, and could not be introduced into the laryngeal cavity without causing spasmodic approximation of its walls. Two days later the operation was again undertaken with a Türck's tube forceps, which proved to be much more applicable. Three days were necessary to effect an extirpation of the neoplasm, the sitting never being prolonged beyond ten to fifteen minutes on each day, and the forceps being introduced but twice. On the second day the patient found that with some effort she was able to pronounce certain

* Ryland: A Treatise on the Diseases and Injuries of the Larynx and Trachea.

† Porter: Observations on the Surgical Pathology of the Larynx and Trachea.

words with tolerable effect, and that two days later she could *speak*. The laryngoscope showed at this time that the glottic opening was freed from the presence of the growth, and that the vocal cords could and did meet at the median line. Some small portions of the neoplasm still remained upon the superior surface of the left cord, near the commissure, and these were removed at the fourth and last—as far as operative interference went—séance. From this time on there was gradual but steady improvement in the patient's voice, the want of clearness at first depending upon the tumefaction and congestion of the cord consequent upon the operative measures taken, and later upon a condition of apparent atony due to the prolonged complete disuse of the laryngeal abductor and adductor muscles especially. This latter condition was bettered by the use of electricity and vocal exercise, while time relieved the first; and on March 23d the patient was discharged with a full, clear, and loud voice.

Case II.—In September, 1876, I saw an exceedingly beautiful illlustration of the size and extent that a laryngeal papillomatous tumor may attain in the person of M. H., aged 28. The symptoms that its

presence caused were mainly an aphonia, which was absolute and which had persisted for many months, and dyspnœa, which of late had become excessive and dangerous, preventing all exertion and even rest at night. Of such a grade was it, that I hesitated whether or no it was not proper to perform a tracheotomy at once, before attempts were made to remove the intra-laryngeal tumor by the natural passages. Had I yielded to the fears that the patient's condition suggested, I should have done so; but experience having taught me that a surprising degree of toleration is established by nature in laryngeal stenosis of a chronic progress, and that we not unfrequently see patients living on such a diminished supply of air obtained with difficulty through a glottic opening so small that, were the same degree of stenosis to occur quickly—were the exclusion of the same amount of air unprepared for and sudden—it would in many instances, I am sure, be insufficient to insure the maintenance of life. I therefore waited, and determined to attempt at least the removal of the growth through the mouth. A small portion of it only, if it were taken from that part which overhung the glottis, and which was drawn into the latter with every inspiration, would suffice to improve matters materially. The result justified this view. Without going into tedious details (I have, in some of the other cases which are embodied in this recital of clinical histories, given in detail various operative steps), suffice it to say that, at the first operation, the greater part of the papillomatous growth was removed without difficulty; its size, extent, and location rendering the operation with a large Mackenzie's laryngeal forceps an easy one. Indeed, it would have been difficult, the forceps once in the larynx, not to have seized at the first sitting large portions of the neoplasm. Laryngeal spasm, which I expected and feared, for reasons readily appreciable did not occur. The result of the removal of such a large portion of the mass, which was blocking up the glottis, was, as might be expected, most satisfactory and comforting to the afflicted patient. "For the first time in months he could breathe easily."

At a second sitting a few days later, remaining portions of the neoplasm, situated mainly upon the left vocal cord and on the inner surface of the left arytenoid cartilage, were removed. This was followed by marked improvement in the voice. A third sitting was devoted to the removal with a small forceps of a remnant of the growth located on the laryngeal face of the left arytenoid. Succeeding in this, and noting that one or two small remaining portions of growth (not larger than a pin's head) at other points were undergoing or had undergone an atrophy after their thorough crushing, further operative interference was not needed. I saw the patient some months subsequently with a clear larynx, free and uninterrupted respiration, and a fairly good voice.

Case III.—The patient, a robust country girl, aged 16, was referred to me for treatment by her physician, in the western part of this State. Her history was as follows: for eleven years she has had trouble with her voice and throat. This has manifested itself by persistent and progressive aphonia, and the ordinary subjective symptoms of a chronic inflammatory process in the pharynx and larynx. She dates the inception of her aphonic symptoms from a severe cold which occurred, according to her mother's statement, when she was five years of age. Her voice had previously been excellent and perfectly normal. Associated with the aphonia, which at this time was of a slight grade, was more or less dyspnœa, occurring chiefly during the night. This latter symptom was the first one to attract the parents' attention, and was naturally considered to be croupous. The symptoms described became very slowly, but still perceptibly and increasingly worse, until within some six years ago, at which time further and more serious manifestations of interference with the respiratory current within the laryngeal cavity developed. The most marked of these, and the one which excited the most alarm, was the frequent occurrence of severe laryngeal spasm, usually at night, and always after any extraordinary physical exertion. Phonation now became a painful and labored process; the voice, at its best, was rough and coarse, but a very few moments sufficed to render even this totally inaudible, and if the effort were persisted in, violent and continued cough at once supervened. Her condition demanding relief, medical aid was sought for the first time. The diagnosis of "tumor in the windpipe" was, according to her statement, arrived at, and medicines administered which had the effect of relieving somewhat the dyspnœa, more or less paroxysmal in its intensity, from which the patient suffered. No examination of the larynx was made. From this date up to the time of my laryngoscopic inspection no new symptoms, but a gradual aggravation of the old, are to be recorded. Dyspnœa and aphonia became steadily worse; active exertion became impossible; violent and harassing cough, during which small pieces of a "fleshy" character and consistency were thrown out of the throat, occurred at intervals. In June last the voice, which, as I have stated, was at times intelligible at some little distance, became totally lost; and four months later—October—the dyspnœa forced her to seek diagnostic and operative aid in this city.

My subjective examination revealed nothing to be added to what I have recorded. The character of her respiration would, perhaps, have attracted the most

immediate attention, demonstrating as it did conclusively, that a most serious impediment somewhere existed in the air-passages to the respiratory current. It was labored; if forced, became slightly stridulous, and was rendered more difficult by exertion or prolonged efforts at conversation. The voice was almost inaudible, and it was only by a *straining* effort at phonation that she could make herself understood, and even then the distance between herself and her hearer needs be short.

The laryngoscope showed at once the cause of these phenomena—the larynx was more than one-half filled by growths whose gross characteristics at once demonstrated their nature: the villous, velvety appearance of the mucous membrane in the neighborhood of the glottic opening; the aggregations, branches, and cauliflower-like appearance of the tumors at once proclaimed them to be papillomatous in their structure. A reference to the drawing will show that they occu-

pied nearly the whole extent of both vocal cords; that on the left side of the larynx they extended well upwards upon the false vocal cord posteriorly, and encroached thence backwards over the inner face of the left arytenoid cartilage. The anterior commissure of the cords was so fully occupied by the neoplasm that its opening was entirely occluded or filled up, and the deepest inspiration possible failed to draw the vocal cords sufficiently apart to afford a clear space. More than one half of the rima glottidis is, therefore, rendered absolutely obstructive to the respiratory current. Its opening posteriorly is likewise encroached upon, but not to the same degree, the irregular nodulated pointed projections simply reaching inwards into its free space—interdigitating, as it were.

The act of phonation—adduction of the vocal cords—crowds these growths together and closes the glottis; the vocal cords remaining at, or but a short distance from, the sides of the larynx. The column of air from the trachea then forces itself upwards through the numerous small fissures and openings which remain between the irregular edges of the growths, but no sound, resembling in any degree a natural one, is produced. Respiration is conducted through the opening which exists posteriorly, and the current of air, in its passage, causes a slight vibratory movement of the apices of the inter-lying growths.

Operative measures were undertaken at once to relieve this condition of affairs, and the throat being capacious and unusually tolerant, no difficulty whatever was experienced in passing Türck's tube forceps, guided by the reflection in the laryngeal mirror, into the cavity of the larynx, and upon such portions of the growth as it was desired to remove at each sitting. A few of the latter—without being prolonged beyond the patient's endurance, or causing too marked an inflammatory reaction—sufficed to clear the vocal cords and overlying parts most completely of all vestiges, root and branch, of the neoplasm.

I might now reasonably expect, judging from the results in other cases, to have the satisfaction of hearing an improvement at least in the patient's phonetic powers, but I was disappointed. To my surprise no such result followed immediately, nor did the improvement manifest itself for several days. The laryngoscope showed me that the cords were clear of the neoplasm, but that they were of a red color, swollen, with rounded edges, and that all proper muscular action in adduction, and their vibratory properties were in abeyance. This condition of affairs was the explanation of the still persistent aphonia.

Inflammatory reaction after my instrumental proceedings was to be looked for; it existed, and to an unusual degree—hence the hyperæmia, the swelling. The long practical disuse of the vocal cords, it is fair to infer, may have given rise to a partial atrophy at least of the laryngeal muscles. These two causes were all-sufficient to prevent an immediate return of voice; and that they were the causes is proved by the fact that under the use of daily applications of an astringent spray into the larynx, the employment of electricity, and systematic vocal exercise, as in the first case that I have detailed, there was constant improvement. The case remained under observation, and with gradually lessened treatment for some three weeks after the operation, the voice continuously developing in quality and force, and was finally discharged from treatment, and allowed to return home, if not with a perfectly melodious and well-toned voice, at least with one which, if a little rough and coarse, answered perfectly all practical requirements, and with one, of which the constant improvement allowed of a favorable prognosis being given.

[A letter recently received (November) leads me to believe that there has been a reproduction in part of the papillomatous growths.]

Case IV.—Jennie B., aged thirty, on an exceedingly inclement night some three years ago was exposed for a long time to the cold and wet, while crossing the river in a ferry-boat. The consequence was a severe cold, with all the symptoms of an acute laryngitis, including absolute aphonia. The condition, after lasting a day or two, subsided, but only to be renewed upon fresh exposure, so that the entire winter passed before the patient was able to consider herself free from her "cold." The state of her voice, then, for the first time attracted her attention; from being clear and full as formerly, it was now constantly hoarse; and at times, for a few moments, would fail her entirely. For the past eight months

the hoarseness has grown slowly worse, and she is now conscious of making considerable muscular effort in order to produce clear sounds from the vocal cords. If this effort be prolonged the voice will be entirely lost for a variable period of time. During phonation she often feels "as if something came in the throat, and stopped the voice;" that is to say, there is a sudden catch in the voice—a sensation of a foreign body in the larynx—followed by tickling, paroxysmal cough, and efforts at clearing the throat.

The laryngoscope shows that there is a more or less ovoid-shaped neoplasm seated upon and partly incorporated with the left vocal cord. It is soft and of a bright red color; in short, presents the general charac-

teristics of a fibro-cellular growth. The only point of special interest in connection with it is, that during phonation it is crowded up between the vocal cords until a considerable portion of it lies upon either one or the other cord; hence, probably, the sensations of which our patient complains. Its removal by means of Türck's laryngeal forceps was at once undertaken, and all that portion of it which was crowded up between and upon the vocal cords during phonation was easily removed. The remainder, lying immediately below the free edge of the left cord, owing to its location, which caused it to be covered and hidden from view, as soon as the cords were spasmodically approximated, a result which followed each introduction of the instrument into the larynx, could not be reached, and after a number of trials the attempts were discontinued. A silver probe, coated with silver nitrate upon the appropriate side, to correspond with the location of the growth in the larynx, was now taken, passed during deep inspiration directly into the patient's widely opened glottis, and then pressed strongly upon the remains of the neoplasm; contact being kept up long enough to thoroughly destroy all portions of the growth. The probe was then removed, and the larynx immediately painted with a solution of sodium chloride. The reaction following this procedure was most decided and unpleasant. Acute laryngitis, tumefaction of the vocal cord and aphonia, was the result, but subsided within a few days. An examination made a week subsequently showed that all vestiges of the growth had been destroyed, and that the vocal cord had resumed its normal appearance. The voice, which after the first operation had been much improved, was now so much bettered that the patient herself pronounced it "as good as it had ever been." As a matter of fact, it was clear, strong, and resonant, and I had every reason to be satisfied with the result.

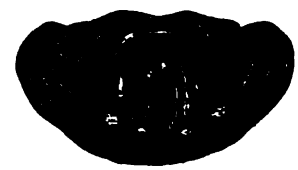
The following two cases represent a class of laryngeal growth which is certainly rare; at least my experience and the meagre, or absence of any, account of them in standard works upon laryngoscopy, would lead me to believe so. Türck alone makes mention of them, and to his excellent work I am indebted for what information I possess upon the subject. They have their origin in a localized chronic inflammation of the submucous connective tissue and the mucous membrane of the vocal cords; a result of which is the formation of a polypoid tumor or tumors of varying size, but usually very small, made up mainly of plastic matter. Whether or no these tumors ever consist of the products of an old inflammatory process having its seat in a mucous follicle, is as yet a disputed point. Upon their size—and, as has already been said, they may be multiple or single—depends, according to Türck, their designation; the smaller, round, opaque, white and numerous, the size of a hemp seed, constituting an affection or appearance which has been termed by him "*chorditis tuberosa*," while the larger, usually a single tumor, of more or less fusiform shape, apparently intimately incorporated with the surrounding tissues and of a whitish-opaque or even a dirty-reddish color, has been classed as the "*polypoid form*," of a chronic and localized inflammatory process affecting the vocal cords. This latter locality is always the seat of either variety, their edges and superior surface forming the favorite points for the localization of the inflammatory products. Four cases of the first form, all occurring on the persons of female singers, and four of the second, have been observed and some of them fully reported by Türck. For the information of those interested I will add, that histories and drawings, as well as the result of a microscopical examination of the neoplasm in one instance, are given in his classical work.

My cases are as follows:

CASE V.—Mrs. J. G., a professional singer (mezzo-soprano), came to me in February, 1876, for assistance in regard to her voice, which she stated was *ruined* ten years ago (she now being 25); she suffered from a severe attack of membranous croup, which passing away left an aphonia of some six weeks' duration. This in turn slowly disappeared, and the voice, subject to occasional relapses into huskiness, again became available for singing. A few months since, following severe exposure and cold, another attack of aphonia developed; this proved to be a most severe and persistent one, and a voice seriously impaired in purity and force was left upon its subsidence. Singing now became a painful process, attended by perceptible muscular effort, and leaving a tired and sore feeling in the larynx and pharynx after it. The change or veiling of tone was most perceptible in the middle register, and its transition into the upper, especially when the voice was forced. Such a condition being of course incompatible with steady professional work, the voice being entirely unreliable and "giving out," on slight provocation, singing was discontinued.

In addition the patient is suffering from some, and has suffered from many, symptoms of an ordinary catarrhal pharyngo-laryngitis.

Upon the left vocal cord, at the junction of the anterior and middle third, situated directly upon, or rather *in*, its free vibrating edge, is an ovoid, opaque, whitish tumor which blends into the surrounding parts, directly opposite to it, that is upon the right vocal cord, is a second similar tumor, but much smaller. Dur-



ing phonation the projections caused by these tumors touch as the cords come together, and before the latter are in apposition; a double glottis is thus formed, its parts being of unequal length, and consequently giving rise to unequal sound-waves, and double notes of a different pitch, result, a discordant voice which is furthermore rendered hoarse and unreliable by the relaxation and catarrhal congestion of the vocal cords themselves. It may be of interest to note at this point, for the information of my fellow specialists, that the experiments undertaken with this patient's larynx to prove the truth of the phenomena described by Schnitzler in his paper on "*Diphthonia*," failed.

The object of treatment in such a case as the above is to cause either a resorption or a destruction of the so-called growth, which will depend somewhat upon its location and size, but especially upon its *age*. In recent cases the former plan may be carried out successfully, while in those in which the tumor has existed for a long period it will undoubtedly fail, and a direct means must be taken to destroy the neoplasm by caustics or forceps if it be large enough and so situated as to be readily seized; although I believe that an opportunity to do this would be rarely afforded, owing to their usually thorough incorporation with neighboring parts. In my case the plastic deposit being of comparatively recent origin, its reabsorption was successfully accomplished by the persis-

tent pencilling of the larynx (twice weekly, with tolerable regularity for six months) with a solution of iodine and iodide of potash in glycerine. I say successfully, because at my last examination there was no remaining evidences of the plastic nodules or growths at the points above indicated, and the patient's voice had regained its strength and was regaining its purity. I believe she has since resumed her singing.

The second case occurred in the person of a professional friend. I give his history in his own words.

CASE VI.—"Some time during the latter part of March, 1876, I took a violent cold and was confined to my room for about one week; at the end of that time resumed my duties, but noticed a slight huskiness in the voice. By the middle of May following I found that after reading aloud or talking for a short time I became decidedly hoarse. An examination of the larynx, which was now made by Dr. L., showed that an extensive hyperæmia of the parts existed, and an astringent course of applications was advised, with rest of the throat. For three weeks treatment was continued more or less regularly; but at the end of that time, believing that the good results already accomplished would lead to permanent relief, my visits were discontinued until the 25th of July following. An examination made at this time, on account of the redevelopment and increase of my former symptoms, showed that the hyperæmia was no longer active, that a chronic laryngitis existed, and had as one of its results given rise to a localized hyperplasia (fibrinous plastic material); this had assumed the shape of a small nodule somewhat larger than a pin's head, located upon the inner border of the right vocal cord at its anterior third. Applications of a solution

of iodine and iodide of potash in glycerine were advised.

"My attendance being still irregular, it was not until the middle of the following October that, becoming alarmed at the steadily increasing hoarseness and difficulty in speaking, I determined to devote time and attention to the treatment of the affection.

"By New Year's Day, having been in regular attendance twice weekly since October 15th, I found my voice so much improved that it was nearly natural. Three applications weekly have been made to the larynx since January 1, and at this date, January 26th (1877), my voice is perfectly restored."

Under the use of the medicament above mentioned, the so-called growth slowly but steadily decreased in size; in so-doing apparently acquiring a much greater density. At least the latter stages of the cure were much slower than the earlier, less impression being made upon the size of the nodule in a given time. At present a slight thickening of the cord at the site of its former locality, and a slight opacity, alone mark its early position.

There is one point in diagnosis which relates to both cases, and which had perhaps be better mentioned before I leave them: this is, that when the cases are first seen there may be some difficulty in detecting the presence of any localized hyperplasia such as I have described above, simply because the general congestion of the parts, attended undoubtedly by more or less thickening and chronic œdema, is usually, I believe, amply sufficient to mark the small nodule or nodules which at this time do not present the same whitish-opaque appearance (due to a fatty degeneration of their interiors), that they do later in the disease, and it may only be after a treatment directed against the chronic catarrhal symptoms has succeeded in subduing to a degree both congestion and tumefaction, that the tumor will appear clearly enough for diagnostic purposes. This *differential treatment* will be less necessary, of course, when the tumor is situated directly upon the conspicuous free edge of a vocal cord, as in both of my cases.

The latter, the vocal cords, seem to be, if we judge from the description of the cases which have been published, the favorite site for neoplasms of this character, and I think that the explanation will be found in the fact that just at this point we have the greatest amount of laryngeal movement—of friction—of more or less continuous impingement. Under normal conditions this of course causes no irritation; but with vocal cords intensely hyperæmic, already more or less acutely inflamed, such irritation cannot but conduce to an increase of the inflammatory action, with consequent infiltration of plastic matter, the *edges* of the vocal cords being the parts which receive most directly the greatest amount of mechanical contact and pressure. Just here we should expect to find the hyperplastic infiltrations or nodules, and just here we do find them as a rule. Perhaps we may in this way explain also why singers, those who use the larynx continually, and often under unfavorable conditions, should constitute the majority in the recorded instances. Another curious proof of the apparent truth of this theory is afforded by my first case. Where directly opposite to and corresponding with the first and primary nodule upon the left vocal cord which projected beyond its free edge, and consequently struck on each effort at phonation a given point upon the opposite cord, was a second and smaller one upon the right, both vocal cords being at the time subject to the same grade of inflammatory action.

CASE VII.—On December 7, 1876, I examined the larynx of A. A., aged 23, a robust young man, free from all syphilitic or tubercular taint, who had suffered from an almost absolute aphonia for some three months. Six months since the voice became husky, and previous to that time he had been subject to the commoner symptoms of a chronic laryngitis. The aphonia has been gradually but steadily increasing

up to the time of my examination. Respiration is entirely unaffected, and there has been no laryngeal spasm. I found the anterior commissure of the larynx to be completely occupied by a large ovoid tumor, which extended backwards between the vocal cords to a point midway between their commissures. It was of a bright red color, smooth surface, and was attached by a broad base just below the cords anteriorly. Its appearance showed it to be fibro-cellular.

Its size and position render perfect apposition of the vocal cords impossible, as it presents a direct mechanical obstacle to the closure of the glottis, hence the aphonia. Our first sitting for operative purposes was on December 12th; I, in the meantime, having demonstrated the case to my class at the College of Physicians and Surgeons, and at it I removed, by means of the laryngeal forceps, the greater part of the neoplasm. The result was most excellent, but not surprising, when the location of the growth is considered. Voice immediately returned, loud and full. The same night there was some soreness of the larynx, and change for the worse in the voice. The next day, however, the latter again improved and continued to do so up to the second operation, on the 15th, when I removed the remaining portions of the growth, consisting mainly of its base. One week later the patient was again brought before the class at the College, and apparently took special delight in exhibiting, at my request, the power of his voice, by filling the large amphitheatre with joyful shouts. Evidently there had been complete and full restoration.

CASE VIII.—P. L., aged 38, was seen by me May 3, 1877, on account of an aphonia from which he had suffered for several months, and which he believed to be progressive. No other symptoms of laryngeal disease of any import. An examination of the larynx demonstrated the presence of a large papillomatous outgrowth upon the right vocal cord, springing mainly from its free edge in its anterior third, and partly from its superior surface. . The tumor lies almost di-

rectly in the glottic opening, and consequently prevents a closure of the cords during phonation. Upon the left vocal cord at a corresponding point to the above, there is a slight irregularity of surface, hardly a hypertrophy which may indicate the future development there of a like growth.

At the first sitting all morbid tissue was thoroughly removed by means of Türck's laryngeal forceps, with resulting *immediate* improvement in the voice. One week later this was confirmed.

CASE IX.—Miss M., æt. 16, was referred to me for treatment in September of this year. She is *absolutely aphonic*, and has been so for the past six months. Seventeen months since her voice began to fail, and has been growing progressively worse since that time. Previously it had always been good, though she has been subject to numerous attacks of sore throat (pharyngitis or tonsillitis). Twice during the past summer she has coughed out fragments of a fleshy consistency, which were evidently parts of some intra-laryngeal growth. She has had no cough, no dyspnœa nor laryngeal spasm, and is in all other respects than those above stated perfectly strong and well. She has been treated by several practitioners, and on various hypotheses. No laryngoscopic examination previous to mine had ever been made. Her larynx was an unusually easy one to examine, and the glass showed plainly the appearances represented in the drawing. A large papillomatous tumor springs from the left false vocal cord, overhanging a second which is attached in the anterior commissure of the larynx. Together they block up more or less completely the glottic opening. The lower growth moves backwards and forwards with the respiratory current.

At the first sitting all portions of the growth, with the exception of parts at the anterior commissure, were removed with the Türck's laryngeal forceps.

The next day these portions were shrunken, and more were seen *below* the vocal cords to the right and left. Those upon the right removed with some difficulty. The next two or three sittings were devoted to

the removal of those portions of the papillomatous tumor which lay below the cords; a very difficult matter, as all who have had any experience in this class of operation will allow. I first tried to destroy them with nitrate of silver on a laryngeal probe, but with only partial success; then resorted again to the forceps (Mackenzie's, opening laterally), which I carried through the open glottis at the proper moment and crowded forward, and finally succeeded in removing all, after many attempts. The larynx is now freed from the neoplasm, and the patient's voice practically restored after the first operation; constantly improving in both strength and quality.

No. 6 WEST 33d STREET.

A CASE OF WOUNDED INTESTINE, WITH EXTENSIVE PROTRUSION.

A NEW METHOD OF REDUCTION.

BY M. STORRS, M.D.,

HARTFORD, CONN.

THE following case is reported as one having some points of interest, viz.: the extent of the injury, the treatment adopted, and the favorable results which followed. J. M——, an Irishman, æt. about 30, returning home from a drinking-saloon at midnight, Aug. 26th, was wounded in the abdomen with a knife in a scuffle with a fellow companion. Dr. J. N. Parker, of South Manchester, was at once called. He found apparently the whole of the small intestine protruded. Requiring assistance, he waited for my arrival, which was about 4 A.M.

The general condition of the patient indicated a severe shock, faint and pallid; pulse 85, weak. Complained of great pain in the small of the back, none elsewhere. Removing the flannel which covered the abdomen, some eighteen feet, as we judged, of the small intestine had escaped. No omentum was seen. The bowels were dark-red from congestion and distended with gas. There was a transverse wound of the intestine an inch in length, from which there was free bleeding. The serous and muscular coats were divided, and the wound presented the oval form. We were of the opinion that at one extremity of the wound the inner coat was also divided. But there was no escape of fecal matter. The probe was not used. The external orifice of the abdominal wound was two inches in length, reaching from just below the umbilicus horizontally to the right. The internal

orifice was an inch or less, closing firmly around the bowel.

The protrusion had occurred whilst running homeward. The abdominal walls rested flatly upon the spine, and the posterior surface of the abdominal cavity. The patient was etherized. The wound in the bowel was closed by three small, interrupted silk threads passing through the outer coats. This arrested the hemorrhage.

Two strong and long silk ligatures were passed through the abdominal parietes, including the peritoneum, one on each side of the wound. These were given to assistants upon opposite sides, with directions to draw with nearly full strength upwards from the wound, and obliquely to each other. The intestine was then worked in with the fingers, an inch or two at each effort. The external wound was closed with the interrupted metallic suture; cloths, wet with spirit and water, were applied, and morphine was given.

Dr. Parker reports that there was pain and vomiting for four days. Pulse reached 120 on the third day. Abdomen not very tender at any time. Bowels moved naturally on the fifth day. Sutures removed the same day. Morphine was not given in larger doses than ¼ of a grain. Discontinued visits on the 1st of Sept. On the 9th, only fourteen days after the injury, the patient resumed his place as foreman in one of the departments of a silk manufacturing establishment.

We may remark that the facility of reduction in this case was due to the traction by the ligatures. When this was diminished or stopped, no headway could be made. When vigorously used, the reduction was comparatively easy and rapid, and the bowel was subjected to much less handling. In a word, this procedure accomplished the following desirable ends:

First. It enlarged the opening beyond the natural limits and beyond the limits through which the parts escaped.

Second. Including the peritoneum in the grasp of the ligatures, there was less danger in the taxis of separating it from the abdominal parietes.

Third. Pressure of the abdomen antagonistic to reduction was removed.

Fourth. An empty chamber was afforded, into which the protruded parts were invited to return and to remain when replaced.

Authors direct that the wound should be enlarged if necessary. If it is a deep and narrow wound, so that the ligatures could not be applied without difficulty, the external orifice, without harm, may be enlarged, converting the wound into one like that which we have described, or like that which the surgeon makes in his operation for hernia—a free external wound, but through the peritoneum a wound as narrow as possible. But where a grooved director can enter the wound, it will be possible in almost every case to insert the ligatures by proper mechanical means.

Hooks, perhaps, could be used instead of the ligatures. In this way we avoid all the risk from further division of the peritoneum, and making use of the natural elasticity of the parts, we not only set free the organ held impacted, but the reduction of a large mass becomes easier and safer.

Dr. Ernst Emil Hoffmann, Professor of Anatomy in the University of Basle, was found dead in his study on the 15th of December. Death had resulted from heart-disease. The professor was still a young man, and had previously been, to all appearance, in the enjoyment of excellent health.

A CONTRIBUTION TO THE STUDY OF AUDITORY EPILEPSY.

By ALLAN McLANE HAMILTON, M.D.

(Read before the Medical Society of the State of New York, Jan. 15, 1878.)

Flourens, Brown-Séquard, and others, have established the intimate relation between the middle ear and certain parts of the brain, and have settled by conclusive experiments that irritation of this part of the auditory apparatus was followed by disturbance of equilibrium. Crum-Brown, in the Journal of Anatomy and Physiology, May, 1874, demonstrated the fact that the various derangements of equilibrium occurring during rapid rotation of the body, were due to variation of pressure of the fluids filling the semicircular canals.

Ferrier says: "The maintenance of equilibrium is an example of æsthetiko-kinesis, and involves the conjoint operation of three separate factors." These are enumerated by this author as: "1. A system of afferent nerves; 2. A co-ordinating centre; 3. Efferent tracts in connection with the muscular apparatus concerned in the action."

The simplest examples of defective co-ordination of these parts is shown in some individuals when the ear is syringed out, and vertigo is produced. In a more serious pathological condition, namely, auditory vertigo, or "Ménière's disease," the want of harmony of the equilibriating apparatus is lost, and aggravated vertigo ensues, during which the individual seems to be turned from left to right; objects moving about him in a horizontal plane when the left ear is affected, and if walking at the time, he unconsciously moves to the wall or fence that may be at his right side.

The pathology of the condition may be briefly stated as an irritation of the auditory nerve, a secondary irritation and anæmia of that part of the cerebrum, spoken of by Ferrier as the co-ordinating centre, and a resulting impairment of the functions of the efferent nerves, and a consequent disturbance of the equilibrium.

As a rule, those forms of chronic aural disease which affect the middle ear, produce at the most but a transient vertigo,* and this is of the horizontal or rotating variety. In the disease I propose to illustrate by the case to be presently detailed, the disturbance of equilibrium seems to be expressed by an "up and down," or, speaking more exactly, a *perpendicular* vertigo, if such a term may be coined.

The experiments of Flourens made in 1822, which served as the basis for other experiments undertaken by Ménière in 1861, show the connection between certain lesions of the ear and varieties of inharmonious movement. Section of the semicircular canals produced movements which were influenced by the direction of such canals. Horizontal or lateral rotation followed section of the horizontal canals; backward movements followed section of the posterior or inferior vertical canals, while movements of progression and pitching forwards were the results of section of the superior vertical canals.

What the special lesion is that would give rise to the disorder of movement which occurs during the intervals of the paroxysm in the following case, must still remain a mystery. It is probable, however, that the lesion was compound.

---

* I mean "transient," as used to imply a brief attack which may be repeated.

Such cases I believe to be rare. Brown-Séquard * states that Mr. Hinton, an English surgeon, has reported several when, after death, no lesion was discovered, except evidences of disease of the middle ear. My friend Dr. Roosa tells me that out of five or six thousand cases of aural disease he has seen, he does not remember but one of this kind.

John W. P——, aged 15 years and 6 months, a stout and apparently healthy boy, well nourished, and presenting no external evidences of disease; family history good. His mother stated that he had always been a rather dull boy, and that at school he was generally behind in his studies and did not seem to learn easily, and when sent on errands he was unreliable and forgetful. There is no history of injury or sudden fright, nor has there been any known predisposing or exciting cause, but at the age of eight years he had a severe attack of scarlatina, which left him with a remaining otitis, most severe on the right side, and resulting in a profuse discharge of pus, which still continues in a modified degree, but is not so excessive as it was a month ago. About six weeks ago he began to syringe his ears with a carbolic acid solution, which had the effect of removing a large mass of what was probably inspissated pus, and his hearing, which had before been quite defective, became greatly improved, and he no longer complained of various subjective noises, such as buzzing and roaring. When the quantity of discharge was diminished his ears became painful, and pressure on the mastoid processes caused much suffering. Ever since the scarlatina he has had frontal and occipital headache, which is always constant. About a month ago he had his first epileptiform attack, and this occurred about noon one day when he was using his syringe. Without warning he suddenly fell to the floor, became convulsed, and in a few minutes recovered, and did not fall asleep, but a semi-unconscious state, however, supervened.

The next attack came on four days after, at 3 P.M. While he was chatting with a friend, he suddenly stopped talking, and fell. This attack was much more violent than the first one. They now became more and more frequent, until about two weeks ago, when on one occasion he had fifteen during twenty-four hours. Since then he has not had so many, having had between one and five attacks every day but one, which was the only day he missed the attack since the commencement. During some of the attacks he is very violent, while in others not so much so. His appetite has been irregular for some time past. An examination made by Dr. Baldwin, house-physician of the Epileptic and Paralytic Hospital, and myself, revealed tenderness on pressure over mastoid processes, but mostly on the right side. He has no definite aura, but peculiar sensations, which he cannot describe, preceding his attacks, which he cannot locate. He complains of vertigo and nausea, and muscular weakness after the slightest exertion. He invariably returns to consciousness almost after the attack, attempts to arise and walk, but is usually quite feeble.

Examination of Ears.—R.: Discharge scanty, thin, and sero-purulent, and, on examination, the membranum tympani is found absent. The tick of a watch is heard only when the watch is pressed against the ear. A roaring sound is always present.

L.: The same examination shows more or less congestion of the tympanum, with evident signs of otitis media; but there is not so much pain on this side, and the hearing is very much better, the ticking of the watch being heard at three inches.

Patient has complained very much lately of deep, severe pain in the frontal, but extending back to the occipital region. With this pain there is dizziness, especially when he stands, thus making it difficult for him to preserve his equilibrium, which is strikingly shown by his irregular movements. When sitting up in bed, he complains that the objects move up and down, and not horizontally, as we would expect to find in ordinary auditory vertigo, and a very interesting and peculiar symptom are the movements he makes to preserve his relation with surrounding objects, his body moving up and down and his head swaying strangely. He is very susceptible to noises and bright lights, either being capable of inducing a spasm at times. Vomiting from an empty stomach is occasional, with dilatation of pupils. The vision of right eye is at times entirely lost, but at others is unimpaired. Muscæ volitantes are frequently complained of. Examination of urine affords negative results.

Observations during an attack or convulsion, which occurs at no regular intervals, but is a constant result of irritation of the internal auditory apparatus:

I. Ear syringed at 9.55 A.M. Patient calm, and not at all nervous; skin of normal hue; pulse regular; temperature normal; pupils somewhat dilated. He passed a good night, and suffered but little pain, though his vertigo was still troublesome. He was placed upon a bed, and the point of an ordinary two-ounce syringe, filled with tepid water, was inserted in the external meatus of the right ear, and the contents gradually expelled. This caused some pain and dizziness, which increased as more water was injected, and when one ounce had been thrown in the patient became suddenly unconscious, and the head was drawn from one side to the other by rapid clonic contractions of the muscles of the neck, and almost at the same time the convulsion became general, the muscles of the back being extensively involved.

About five seconds after this, there were clonic spasms of the muscles of the jaw, so that the patient snapped his teeth, and, at the same time, forcibly inspired, giving vent to a peculiar noise which might be easily compared, by a person of lively imagination, to the bark of a dog.

This paroxysm lasted two minutes, and during its continuance the pupils were widely dilated. The patient remained unconscious; but there was neither pallor nor suffusion of the face. Thirty seconds afterwards, a period of muscular relaxation succeeded, a fresh attack followed, during which there was more marked opisthotonos, much more noise, but no frothing at the mouth. Pupils still dilated, though perhaps not so much so as at first, while the skin was slightly suffused; but there was no duskiness. Duration, one and a half minutes. *Ten o'clock and thirty seconds*, after slight relaxation and subsidence of movements, the lateral jactitation of the head again began, and at *ten o'clock and one minute* a violent accession of clonic, and afterwards tonic spasms made their appearance. The eyeballs had throughout been uncovered, and at first were stationary and immovable, or almost so; but now they were agitated by nystagmatic movements, and the pupils were dilated. This paroxysm lasted but thirty seconds. At *ten o'clock and three minutes* there was another seizure, during which the left sterno-cleido-mastoideus was involved in a prolonged tonic contraction. The pupils now partially returned to their normal condition, which was one of slight dilatation, and at *ten o'clock and four minutes* the patient became semi-conscious, answered questions

* Central Nervous System, p. 96, and Gaz. Méd. de Paris, 1842, p. 25.

in monosyllables, and after a few minutes recovered entirely. The pulse suffered no variation, except perhaps after two minutes had elapsed from the beginning of the seizure, when it seemed to increase in volume, and perhaps slightly in rapidity. There was an entire absence of any external evidence of asphyxia, which is so marked in the more familiar form of epilepsy.

N. B.—Since the above paper was read I have ascertained that the convulsions may be precipitated by simply blowing into the external auditory meatus.

A CASE OF IDIOPATHIC SYMMETRICAL OSTEOMYELITIS, ANALOGOUS TO RHEUMATISMUS ARTICULORUM.

DEATH ON THE SEVENTH DAY—AUTOPSY.

By CHARLES CARY, M.D.,

BUFFALO, N. Y.

October 9th I was called late in the afternoon to see a child, S. M——, living in the German part of this city.

I found a little girl with the following family history, and a disease presenting the following symptoms:

She was seven years of age; was one of twins; had never been robust, but also had never had any serious illness. Family history of parents particularly healthy.

The child had been ailing for ten days, but was running about until five days previous to my first visit. At that time she complained of pain in the legs and hip-joints; was delirious at times; insomnious; understood all questions asked, but answered unintelligibly; took readily what was offered as nourishment, but had vomited frequently during onslaught of disease; bowels constipated; appearance of countenance, particularly anxious.

The thighs were rotated out so as to allow the legs and thighs to rest evenly on the bed; the legs were slightly swollen, and œdema was discovered extending half way up along the tibia.

The disease had first made its appearance in the left ankle, but within the first twenty-four hours had also invaded the right. Both joints, at the time of my first visit, presented the same appearance of redness and slight swelling, and was identical to acute articular rheumatism. No injury had been inflicted other than a slight blow upon one malleolus four days prior to the invasion of the disease; and, as I stated, both malleoli and both ankles presented at the time of my first examination this rheumatic appearance. The pulse was 120; temperature, 103°.

Gave anodyne to overcome insomnia and pain.

October 10th, 10 A.M.—The child had slept well under the influence of Pulv. Doveri, grs. v., but presented much the same appearance as on previous evening. Pain in the hip somewhat increased; redness and pain from ankles were extending up the leg along the tibia; œdema at this time showing itself as high as the knee. Pain in hip only felt when the femur of corresponding hip-joint was moved. The appearance of thighs was normal, but there being so much pain it was thought that the same disease which had shown itself in the legs with so much violence was extending itself along the thighs as well, though it seemed to make itself known more at the articulations than in the shafts.

All the articulations were movable, but the pain accompanying motion was intense. Child cried out frequently with pain, referred in part to legs, and in part to abdomen. Urine high colored and scanty; bowels still costive. Pulse 130 per min.; temp. 104°. Gave sulph. morph., grs. ¼ p. r. n.; sodæ et potass. tart., grs. x. Sig. every hour and a half. Spts. frumenti and beef essence as much as could be tolerated.

Oct. 11, 10 A.M.—Called consultation. The patient had been unable to retain salts, but the nourishment had been well borne. All redness had disappeared from along tibia; redness about ankles remaining the same. Tongue typhoid in character. Pulse 114; temp. 104¼°. Thorough physical examination made with negative results further than what has already been stated.

The great similarity between existing symptoms and symptoms of rheumatism rendered diagnosis uncertain, but osteomyelitis was suspected. 4 P.M.: Some improvement in general; tongue clean. Anxious expression absent; more intelligence. 7 P.M.: Patient died.

Post-mortem examination sixteen hours after death. Ecchymotic spots along posterior parts of legs and thighs; no appreciable difference observed in size of legs or thighs.

The examination obtained with difficulty and not thorough, owing to objections on part of parents.

An incision made along one tibia was followed by free flow of thin dark pus, with many shreds and strings; tibia softened and completely denuded of periosteum; pus was found under periosteum and completely surrounding the bone; every portion of the tibia which could be investigated through this opening was found in this same condition.

The disease had spread itself evidently by continuity throughout the entire bone. Though the parents rendered it impossible to make a more complete examination, it was thought by those present, who had seen the patient in consultation, that the thighs were in a like condition.

Diagnosis, osteomyelitis. Before closing I would state that, the disease being symmetrical, beginning in the joints and presenting the external appearances of rheumatism, together with its sudden attack, rapid progress, and great constitutional disturbances, it being devoid of traumatic origin, all rendered the similarity most striking and complete between symmetrical osseomyelitis and acute articular rheumatism. The one a very rare, and the other a very common affection.

THREE CASES OF PUDENDAL HEMATOCELE IN VIRGINS.

By G. H. BENJAMIN, M.D.,

ALBANY, N. Y.

The difference of opinion that has existed between writers on this subject, in relation to its occurrence in a non-pregnant state, has led me to report the following cases, which have come under my observation during the past two months:

Case I.—Miss A.——, aged 19 years, is strong, healthy, and of large physique, has never suffered from any sexual difficulty whatever. Upon being called to attend her, "she stated that in descending the stairs she had in some manner caught her foot in the carpeting, and had been thrown violently to the foot of the stairs." Upon regaining her consciousness, "she felt a burning and prickling sensation, and a feeling as though something had given way near the vulva."

Making an examination, I found a tumor occupying the areolar tissue of the right labia, in size about that of an egg.

Case II.—Miss S., aged 23, met with the accident while skating. Coming in contact with another

skater, both fell, she striking the vulva on the skate of the other party. She immediately felt pain, burning, and the sense of giving way. Examination revealed the presence of a tumor occupying the entire length of the right labia. Both labia were very much bruised and swollen. The sharp point of the skate had made an ugly wound in the perineum, about an inch in length, dividing the sphincter muscles of the vaginæ and anus. The tumor was the size of an orange, very tense and painful; for an hour it continued to enlarge. Local applications were ordered, and sufficient opium given to insure rest.

CASE III.—Miss D., aged 21 years, employed as a servant, received the injury by falling and striking the part violently on the handle of a wash-tub. In this case the tumor was small, but little larger than a walnut, and situated rather higher on the labia than the others; there was little pain, and it could be moved backward and forward, simulating very closely a hernia.

In each of these cases the same treatment was adopted, viz., flaxseed poultices, until pain and inflammation had subsided, after which I introduced a small needle connected with a "Dieulafoy aspirator," and removed such fluid as the sac contained, after which an injection of alum, grammes viij. to water ʒ i. was injected and allowed to remain five minutes. The sac was then opened, and the finger introduced, and the clots removed. No hemorrhage of any consequence occurring, a simple pad and T-bandage completed the dressing. Recovery in each case was rapid. My object in using the aspirator and the injection of alum was to produce as firm a clot as possible, to control hemorrhage, and to excite a little inflammatory action for the purpose of closing the wound quickly.

It may be said that these cases are not fair examples, being entirely due to traumatic causes, but I have yet to learn of a case occurring in the pregnant or non-pregnant state, that can be said to be *purely* idiopathic in its origin. The fact that in each of these cases the tumor occurring on the right side, seems to add weight to the statement of Boer, viz., "that the right side is more frequently the site of this condition." In the first case cited there were no signs of direct violence, the condition being due to muscular strain.

Progress of Medical Science.

SEXUAL EXHAUSTION.—According to Dr. H. C. Wood, Jr., this condition may be due to onanism or excessive venery. The treatment of masturbation he divides into hygienic, medical, and surgical, but adds that he has never yet seen a case requiring surgical interference. Of course the habit must be given up at once; then the hygienic treatment is in order, and this consists in plenty of physical exercise, use of farinaceous food, abstinence from meat as far as possible. Whatever tends to excite and irritate the genitals in the way of exercise, company, literature, etc., should be absolutely forbidden. The object of the medical treatment is to subdue the excessive irritability of the parts, and this may be done by potassium bromide, grs. xx. to. grs. xxx. three times a day, or bromated camphor, grs. v. in emulsion at the same intervals. Iron and some bitter tonic may be profitably employed in conjunction. Ergot is frequently of use. In the treatment of excessive venery, continence is again requisite. Where the emissions are numerous, the same hygienic measures as in cases of masturbation must be employed. Nourishing food, warm clothing, and plenty of sunlight and exercise are indispensable. Iron, bitter tonics, and the bromides are indicated. Phosphorus is a specific remedy, and may be given alone or with ergot. Impotence, due to excessive irritability of the organ, should be treated with continued doses of the bromides. Where there is loss of power without irritability, the tincture of cantharides and the tincture of chloride of iron should be given. In impotence with spermatorrhœa, the tincture of cantharides acts like a specific, but it should not be given where debility is absent. If further treatment be required, cold bathing, strychnia, and electricity may be employed.—*Medical and Surgical Reporter*, Dec. 22, 1877.

RESULT OF THE BROWN-SÉQUARD TREATMENT OF EPILEPSY.—Dr. James B. Ayer reports twelve cases of epilepsy in which systematic treatment has been followed. In all, the following prescription was given:

℞. Sodii bromidi,
Iodinii bromidi,
Ammonii bromidi, āā..... ʒ iij.
Potassii iodidi,
Ammonii iodidi, āā..... ʒ iss.
Ammonii sesquicarb..... ʒ i.
Tinct. calumbæ..... ℥ iss.
Aquæ destillat., ad,..... ʒ viij.
M.

Full Dose: One and a half drachms before each meal, and three drachms at bed-time.

In four cases the results were very satisfactory; reduced to a single attack in forty-six months, thirty-one months, twenty-two months, and sixteen months, respectively. In five cases, number and severity of attacks both diminished; in one, severity diminished, number unchanged; in two, no change in number or severity. In eleven cases there has been *marked* improvement in general health and mental condition; in one there has been slight improvement.

An extra dose taken at the appearance of the first premonitory symptom, very often succeeded in averting a threatened attack. There was but little iodism or bromism.—*Boston Medical and Surgical Journal*, Dec. 27, 1877.

SPINA BIFIDA TREATED SUCCESSFULLY BY INJECTIONS OF IODINE.—Dr. Leal, of Kendallville, read before the N. E. Indiana Medical Association, the report of a case of spina bifida in which the sac was injected with tincture of iodine, with most satisfactory results. The patient was a boy, three months of age, presenting a fluctuating tumor at the junction of lumbar and sacral vertebræ. The tumor was pedunculated, and could be emptied by pressure, but whenever this was attempted, the evident irritation of the nervous centres gave ample evidence of the communication between the sac and spinal canal. A cord was placed around the pedicle of the tumor, apparently with the object of closing the sac, for it was at no time tight enough to cut off circulation. The sac was then tapped, several drachms of fluid being withdrawn, and half a drachm of the diluted tincture of iodine injected; strong tincture of iodine was painted on the outside, and adhesive strips were applied to press the tumor against the child's body. The lump inflamed, the sac closed, and in twenty-two days the case was dismissed. This was done four years ago, and to-day the child gives every evidence of being perfectly

cured. The application of the ligature is considered one of the principal points of the treatment, without which the operation would be dangerous, but where this is impossible, Dr. Leal suggests the possibility of transfixing the base and applying multiple ligatures. —*Detroit Medical Journal*, Dec., 1877.

ROTARY LATERAL CURVATURE OF SPINE AND THE PLASTER-OF-PARIS JACKET.—It is not recommended that all cases of lateral curvature be treated by the plaster jacket. One case, caused by an inch and a quarter shortening of one extremity, was cured by adding that amount of extra sole to the shoe of the affected side, but the majority of cases are believed to be caused by the inability of the spinal column to support the weight of the head and shoulders. Dr. Sayre removes this burden by suspending the patient by the head and hands, allowing the weight of the body to straighten the vertebræ, and while in this position he applies a plaster jacket. The immediate effect of this treatment is claimed to be very good, but he gives no very positive prognosis as to the ultimate result. Suspension by the head and hands was first practised by Dr. Benjamin Lee, of Philadelphia, in following out the idea of the late Dr. Mitchell, who recommended suspension by the hands alone, though he never brought it prominently before the profession.—*Medical and Surgical Reporter*, Jan. 5, 1878.

POISONING BY SMALL DOSES OF GELSEMIUM.—Dr. Wharton Sinkler ordered fluid extract of gelsemium in doses of five drops, three times a day, for a case of facial neuralgia. The treatment was continued nearly two weeks, when the doctor was suddenly called to his patient, whom he found lying on a sofa, unable to sit up or to move at all. The extremities were cold, the pulse small and feeble, respirations sighing and jerky, pupils dilated, and the eyes suffused. There was paralysis of the bladder, the urine dribbling away constantly, and although there was general muscular enfeeblement, it was most marked on the right side. The family said that the symptoms had first appeared on the day previous, but only to a slight degree, becoming rapidly worse during the morning. The patient had taken the gelsemium three times the day before, and once that morning. They were sure not more than five drops had been given at a dose. She was put upon potas. bromid. grs. xv., and morphiæ sulph., grs. $\frac{1}{4}$ every two hours, and in a few hours was much relieved. It was now found that from the first the drug had produced loss of power over the bladder for an hour or two after each dose. The neuralgia was in no way modified.—*Philadelphia Medical Times*, Jan 5, 1878.

SOME AFFECTIONS OF THE NERVOUS SYSTEM DEPENDENT ON A GOUTY HABIT.—J. Russell Reynolds defines the "gouty habit" as a "toxæmia," chronic in its duration and multiform in its phases, a "blood poisoning" induced *within* the system. That which has led him to ascribe so many of the so-called "nervous affections" to this gouty habit, may be thus summarized: 1. The actual presence of gout in the joints of the individual at the time, or at previous times. 2. The evidence of gout in ancestors or collateral relatives. 3. Frequent occurrence of acid eructations, with chronic dyspepsia. 4. The emission of pale limpid, acid urine, of a low specific gravity, and with traces of albumen, or sugar, or both. 5. The variability of symptoms, both as to kind and place. 6. The presence of some alterations in skin-nutrition, such as eczema and psoriasis. 7. The impossibility of referring the symptoms to any known disease of brain or spinal cord. 8. The immediate relief of such symptoms after treatment by colchicum and saline aperients, although simple purgation and treatment upon many other principles had failed. He has adopted the method of describing "groups of symptoms" under five headings:

I. *Mental Disturbances.*—Patients complain of great restlessness; are alternately excited or depressed; sleep badly; are intensely hysterical, etc., all of which symptoms disappear under treatment upon this hypothesis. This group may alternate with, or accompany the next.

II. *Pain in the Head.*—Sometimes very intense; is confined to one side of the head, usually parietal or occipital; without over-sensitive nerve-points, or tenderness of scalp, and is not increased by mental exertion.

III. *Modified Sensations.*—1. Vertigo. 2. "Noises in the ears." 3. Deafness and "beating in the ear." 4. "Numbness," "tingling," "creeping," "deadness," or some other altered state of sensibility in the limbs. The most characteristic sign of their gouty origin is their variability in kind and locality. Darting pains, resembling those of ataxy, are very frequently met with. Sciatica, often shifting, and myodynia of all localities are common.

IV. *Modifications of Muscular Action.*—1. Cardiac palpitation, intermittent or irregular pulse, or painful aortic pulsation at and below the epigastrium. 2. Flickering contractions of muscles in limbs; tonic spasms; "startings" on falling asleep; priapism without erotic feeling. 3. Local weakness of muscles, as ptosis; want of co-ordination, giving an ataxic gait.

V. Lastly, symptoms which he simply enumerates as helps to diagnosis. 1. Dyspepsia, cardialgia, distention of stomach and colon with flatus, pyrosis, and acid eructations. 2. Varicosities of veins, with tendency on slight injuries to occlusion of veins. 3. Brittleness and vertical lining of the nails of both fingers and toes. 4. Slight conjunctivitis with occasional chemosis.

These groups of symptoms sometimes coexist, sometimes alternate, and their phases are often very puzzling, but under the treatment proposed disappear with a rapidity quite magical, and reminds one of that beautiful process of clearing a photographic picture by cyanide of potassium.—*British Medical Journal*, Dec. 15, 1877.

HERNIA OF THE SEMI-CIRCULAR LINE.—M. Daniel-Mollière, of Lyons, reports a new case of this variety of hernia. It occurred in a woman fifty-five years of age, and had first become apparent about a year previously. At this time, under the influence of a fibrous tumor of the uterus, she was suffering from considerable ascites, with enormous distention of the abdomen. A few days later severe pains were felt about the middle of the semi lunar line, and soon after a tumor made its appearance. A quack passed a seton through the tumor, giving exit to about twenty litres of fluid, according to the statement of the patient. This wound healed, but a reducible tumor remained, which was easily proved to be an intestinal hernia, and which was retained in position without much difficulty by means of a truss. The author remarked that this abdominal ectasis, occurring at this point under the influence of an enormous distention of the abdomen, seems to prove the existence at the border of the right rectus of a *locus minoris resistentiæ*, a feeble point which permits of distention, and gives passage to these herniæ, as the quadrilateral space of the lumbar region allows the escape of the hernia of J. L. Petit.—*Gazette des Hôpitaux*, November, 1877.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., Nos. 27 Great Jones St., N. Y.

New York, February 9, 1878.

MEDICAL INSTITUTIONS IN THE UNITED STATES.

A MODEST pamphlet of sixty pages, printed as a special report, prepared for the Bureau of Education, and entitled "Contributions to the History of Medical Education and Medical Institutions in the United States," has just been issued at Washington. The author, Dr. N. S. Davis, published in 1850 a small volume on the same subject. It has been out of print for fifteen years, but considerable of its material is now republished. The plan of the work has been to treat the subject topically rather than philosophically, and the result is a statistical exhibit of the development of medical education here rather than a connected historical monograph. This renders the work doubly valuable in some respects, though necessarily dry and uninteresting, save to members of the medical profession. The bibliography of the subject is so limited, however, that the general reader will be glad to know where a collection of the facts can be obtained. Dr. Beck's paper in the Transactions of the Medical Society of the State of New York, to which reference is made, is difficult of access, and Dr. Toner's monograph, 1874, also quoted, is but a Bureau of Education document. It appears from the slender data gathered by Dr. Davis, that in 1776 there were about four hundred medical men in the United States, most of whom had received their medical and literary education in European institutions. Only two medical colleges were in operation here, to wit, the Medical College of Philadelphia, now the Medical Department of the University of Pennsylvania, and the Medical Department of King's (now Columbia) College. Only fifty-one medical degrees had been conferred by both prior to 1776. Hence, our medical history is practically limited to a century, during which has been built up a vast but unsifted mass of schools and literature, the principal data of which Dr. Davis describes in his pamphlet. The latter also includes medical legislation in the various States, and notes by the way on the standards of medical education prevalent at different stages in the development of our educational system. The organization of medical societies is briefly mapped out in a few valuable concluding pages.

But what concerns our purpose in the main, because of its vital influence on the future of medicine, is that the germs of higher standards of medical education were planted in this State as early as 1839, in a recognition, by resolution of the Medical Society, of the only method of thorough reform—the separation of the power of conferring degrees from faculties of medical instruction, and the vesting of the former in State boards of examiners. In 1844, Dr. Davis brought the subject prominently before the New York State Medical Society again; in 1855 it was a third time discussed by the same body, and a call for a convention of delegates from all the medical colleges and societies of the United States was issued. From that convention, held in this city in May, 1856, came the American Medical Association. Meanwhile, in 1837, a similar movement had been set on foot in Philadelphia, which went as far as organizing an institution for the sole purpose of examining candidates and conferring degrees, and a petition signed by one hundred and twenty-six physicians was presented to the Legislature asking that body to give it legal effect and sanction. Of course, it came to naught; the Legislature not being prepared to confess the need of a higher standard. It is quite probable that the colleges had some hand in defeating the measure also.

There is no doubt that the very extraordinary numerical development of medical colleges in the United States has had a tendency to stimulate emulation in methods of instruction, to lead colleges to secure the best professors possible, and to compel each by sheer force of rivalry to equip its laboratories and museums in the most efficient manner attainable. Another result, not so favorable to an advance in standard, has, however, followed directly and inevitably upon the multiplication of institutions. They have been led to shorten their annual courses, even to abridge them from three to two years, and to insist less rigorously (and in some instances scarcely at all) upon preliminary training. In this practical age, a young man, having once decided to become a doctor, naturally inquires where his degree can be obtained with the least expenditure of time and money; and colleges have gradually yielded to this exigency, one after another, on the ground that not to yield would be to maintain a staff of professors to lecture to an empty class-room. The depreciation in value of medical diplomas, and loss of prestige as one of the learned professions, have been the results. It appears that Latin and Greek, and the writing of a Latin thesis, as preliminary to matriculation, were abandoned by the medical department of the University of Pennsyl-

vania as early as 1792. Natural philosophy, natural history and botany soon followed; and the example of one of the oldest institutions in the country has naturally been accepted as a convenient and politic standard by colleges of more recent origin.

As Dr. Davis very justly observes, the general acceptance of the college diploma as a full admission to practice is wholly responsible for this deterioration. On the contrary, if there were State Boards of Examiners, independent of college faculties, who should grant licenses to practise only upon thorough examination, the case might have been entirely different, and these would have created a censorship dreaded at once by the candidate and by the college presenting him. For the candidate there would have been the risk of rejection; for the college the loss of repute consequent upon a too large percentage of such rejections. The duty that the American Medical Association has before it, therefore, is to press in every State for the creation of such boards, and for a uniform standard to be adopted by them. Of course, a reform of this magnitude must necessarily make slow progress, and will meet with determined opposition from at least one-third of the medical colleges now in operation; for out of our sixty-four medical schools, one-third, according to Dr. Davis, are so situated that they can furnish students with no adequate facilities for clinical instruction, and such must of necessity be extinguished. To elevate the standard of preliminary training is, unfortunately, not so simple a task as that of raising the strictly medical standard. A convention of the colleges themselves, to agree upon a uniform standard, appears to be the only practicable solution.

THE NEW YORK HOSPITAL.

ALTHOUGH considerable space has already been given to an account of the reopening of the New York Hospital (see MEDICAL RECORD, volume for 1877, No. 12), the official report of the Building Committee and the address of Prof. Van Buren, just issued in a handsome pamphlet, naturally invite further comment. Our previous article was mainly concerned with the history of the institution that was so long a prominent landmark on Broadway, and with a description of the new hospital buildings. It will not be questioned, perhaps, that the latter are as perfect in all their details as lavish expenditure can make them, nor that the new hospital is in many respects a model of convenience and elegance. But its present situation is hardly one well suited to hospital purposes; and considering the number of patients it is capable of receiving, it is difficult to resist the conviction that the new arrangement is a monument of extravagant if not prodigal expenditure. It should be remembered always that a public hospital ought not to expend in costly erections and appurtenances that which should properly be expended in the legitimate function of such an institution, the treatment of the sick and suffering, and that even a private or associate institution lays itself open to criticism, when its building expenditures exceed the limits called for by the necessity of securing the best attainable hygienic conditions. However, the financial report is not just now under consideration, and extended comment in that direction is scarcely relevant to our present purpose. What the buildings lack in space and roominess they compensate for in elegance and perfection of detail; and opinions upon the management of hospital funds may reasonably differ without either calling in question the propriety of the other. In regard to the building itself, there are some matters which are amenable to criticism. In the first instance, the soil was not well adapted to the purposes of such an erection, and to secure a perfect foundation was a matter of considerable anxiety; for, while the bottom was so soft a rod could be forced down to a depth of forty-eight feet on the west end of the lot, solid rock cropped in upon its eastern limit. Considerable preliminary outlay was necessary to overcome this difficulty, as the sustaining capacity of the soft soil was only about two tons to the square foot. As, however, the work has been satisfactorily accomplished, it seems ungracious at this late day to dwell upon these details.

The address of Dr. Van Buren, however, or rather that part of it in which he discusses the sanitary arrangements of the new structure, naturally calls for some remarks. On page 21, that eminent surgeon intimates that with Lister's appliances hospitalism need not be feared hereafter at the New York Hospital, although he pretty frankly admits that in the matter of hospital hygiene, as in that of hospital construction, science has not yet spoken her last word. It may as well be added also that there are still doubts as to the exactness of M. Pasteur's conclusions and as to the strictly scientific theory of Lister's method, although but little question remains as to the practical value of antiseptic surgery. "It is immaterial," says Lister, "how many stories or wards there may be in a hospital, provided the details of the antiseptic method are accurately carried out in all of them. If these details are faithfully observed, hospitalism can be prevented." But these, Prof. Van Buren should remember, are the words of a theorist, who, as the Italians wittily say of such, has a grasshopper in his head. The practical question is to carry out such details with as little trouble and cost as possible; and it remains to be seen whether the new hospital buildings are well adapted to this purpose. They certainly afford an opportunity to show what comparatively perfect ventilation can accomplish for patients, combined with cleanliness, excellent sanitary regulations, and the Lister method. But it is speaking a little too positively, though Prof. Van Buren's enthusiasm is of a very pardonable kind, to announce that hospitalism need

not henceforth be feared. Time will determine that question in its own way, and it is never worth the while to hazard unnecessary prophecies upon dubious issues. The most unfortunate thing that can happen to a scientific man is to be caught prophesying incorrectly.

To be sure, old things must pass away, no matter what our sorrow in parting with them, but every artist eye missed a picturesque passage when the old New York Hospital disappeared from Broadway; and, with all its costly appliances, its tiled floors and Turkish carpets, its Eastlake furniture and solarium, the new structure can never efface the memory of the old Broadway institution which for so many years was the leading hospital in this country. Indeed, in point of patronage, the New York Hospital has now ceased to be superior to others in this city, and in prestige it seems to have lost something of its supremacy also. It is possible that the period of migration may have had a material influence in bringing about this state of things, and that the institution will soon recover its former hegemony. Until then, neither Lister's method nor Eastlake furniture can renew the brilliancy of its record during the three-quarters of a century when it sojourned on Broadway, and commanded the great resources of such men as Dr. Wright Post, Dr. Valentine Mott, Dr. A. H. Stevens, Dr. F. U. Johnston (the first to relinquish the old treatment of fevers by depletion), and Dr. John Kearney Rodgers —to say nothing of the long list of brilliant names upon its roll, from Kissam to the lamented Gurdon Buck. Indeed, nearly every surgeon identified with the old "City Hospital" has come down in surgical history as the originator of difficult and daring operations; and if the new one is to vindicate its claim as its successor, it must be by means of a surgical record as striking and brilliant.

ASYLUM MANAGEMENT IN NEW JERSEY.

A BILL is pending before the Legislature of New Jersey, advocating some change in the government of the insane asylums of that State. It provides for a board of visitors to the asylums, to consist of one member from each board of chosen freeholders in the respective asylum districts. The argument in favor of the bill is that the counties pay about $3.75 per week for the support of each patient in the asylums, out of a total cost of $4.75 (the other dollar being paid by the State), and that the said counties should have an authoritative supervision over the institutions.

We fail to see how any possible objection can be offered to such a proposition, inasmuch as it involves the recognized associations of taxation and representation, and the vindication of one of the fundamental principles of free government. But, aside from this, the very reason why the officers of the asylums oppose the measure, on the grounds that it is of no use, and that the visiting boards would be a nuisance, is, perhaps, the strongest argument in favor of the change. There does not appear to be any provision in the bill which tends to give these inspecting boards any actual control of the asylums, or any direct power to manage them, but simply to vest them with the requisite authority to superintend the manner in which the funds of the counties are dispensed.

So far, then, the asylum officials should be pleased to favor the passage of the bill, as it enables them to share the responsibilities of the pecuniary management of these asylums with a perfectly impartial board. In this connection, and as an offset to the discussion which this bill has introduced before the committee, the State Comptroller has appointed an agent to visit the various counties for the purpose of ascertaining the cost of supporting lunatics in county asylums and alms-houses. As this is a question, the settlement of which at this time is particularly interesting, we have hopes, even if the bill does not pass, that much good will be accomplished by the collateral investigations which the presentation of said bill has made necessary.

PROFESSIONAL OVERWORK.

DR. T. A. EMMET, in his admirable memoir of Dr. E. R. Peaslee, read before the Medical Society of the County of New York, remarked that the subject of his sketch died of overwork. No one can doubt this fact, and no one similarly situated as was Dr. Peaslee should fail to heed the lesson which his untimely death affords. It is a well-established fact that ultimate success in our profession means hard work, and when this success is attained, it is still harder to restrain a desire to work within proper limits. There is a fascination about professional progress which increases with the means of its gratification until in some it becomes almost irresistible. This fact was strikingly exemplified in the case of Dr. Peaslee. The members of the Medical Society of the County of New York will remember that it was but a short time since that he, in some remarks upon the death of the lamented Dr. A. B. Crosby, referred to the necessity of conserving the vital forces, and guarding against the very excesses of labor to which he himself fell a victim. Every one who heard him on that occasion must have been impressed with the conviction that he appreciated the full force of his remarks and governed himself according to their spirit. But, alas, scarcely six months elapsed when, in the same hall, Dr. Peaslee's memoir offers a melancholy verification of his own warnings.

THE POUCHET MONUMENT IN ROUEN.—A monument has been erected in Rouen to the memory of F. A. Pouchet, whose name is indelibly connected with the questions of spontaneous generation and the globular state of fluids. It was built by public subscription, and was formally unveiled on the 29th of last December. M. Pennetier, the Director of the Museum, delivered the eulogy. The monument, which consists of a bust surrounded by a peristyle, is placed beneath the entrance to the Museum of Natural History.

Reports of Societies.

NEW YORK PATHOLOGICAL SOCIETY.

Stated Meeting, December 12, 1877.

DR. E. G. JANEWAY, PRESIDENT, IN THE CHAIR.

CURIOUS CONGENITAL DEFORMITIES OF UPPER AND LOWER EXTREMITIES.

DR. M. P. JACOBI presented a child with congenital deformities of the upper and lower extremities. It was the ninth child of healthy parents, and was now six months old, very healthy, with a well-formed head, and remarkably lively and intelligent countenance. The deformities were caused by multiple arthritis, with accompanying paralysis of the muscles of the corresponding limbs. Both elbow-joints were anchylosed, the arms being in extension. Some slight movement could be effected at the right elbow, but none at the left. The fore-arms were in pronation; the hands flexed and deviated at the wrist on the cubital border—as in arthritis deformans. There were, however, no deformities around any of the articulations; all the muscles of the fore-arms and hands were paralyzed, flabby, and atrophic. Not only response to the will was lost, but also to the faradic current. The galvanic current acted feebly, but there was no degenerative reaction. The scapulo-humeral articulation and the muscles of the arm were healthy

The lower extremities presented analogous lesions. The femurs were abnormally short: the knees strongly flexed, and each presenting on the anterior aspect two or three shallow round depressions about the size of a bean. Extension could only be made partially. Both feet were in talipes varus, and all the muscles of the leg and ankle-joint were paralyzed, flabby, and atrophic, with the same electrical reactions as those of the fore-arms. The cause of this double lesion must be either spinal or local, for the cerebrum was evidently not involved. We might ask whether the paralysis was the original lesion—produced by some extensive myelitis, of which the arthritic lesions were also symptomatic, as in the spinal arthropathies described by Charcot, or the arthritis deformans occurring in tabes; or, on the other hand, whether a multiple synovitis, a fœtal rheumatism had not caused a reflex paralysis, first of the muscles around the joints involved (elbows and knees), then of all the muscles of the limbs below these joints. A thesis by Vallat had recently been published in Paris on such paralyses in adult synovitis. The thesis extended the classic observation, long since made, of paralysis of the deltoid after inflammation of the shoulder joint, and contained observations of Le Fort, Gosselin, Ollivier—even some from John Hunter—where analogous paralyses had been observed after synovitis of various articulations. Vulpian explained such cases as a reflex trophic irritation of the muscles surrounding the joint, starting from the sensitive nerves of the synovial, and reflected to the muscular nerves. Dr. Putnam-Jacobi was inclined to consider the present case as an example of such a morbid process. In adult life recovery was the rule, but it was conceivable that a trophic irritation of muscular tissue in the fœtus should be followed by more profound and permanent results. It was not absolutely impossible, however, that the muscles should still be restored by galvanism.

VISCERAL SARCOMA.

DR. BRIDDON presented some specimens of visceral sarcoma with the following history:—Rebecca M., æt. 24, single, teacher, was admitted to the Presbyterian Hospital, June 2, 1877, service of Dr. Briddon. She then had a large, movable, resisting tumor in the gluteal region below the crest of the right ilium. In itself it was not painful, but gave pain by its pressure. It had been four or five months coming. Its etiology not known.

On the 7th of June the tumor was removed. Under the microscope it proved to be a *cysto sarcoma*. The wound was progressing rapidly toward cicatrization when, on the twentieth day after its removal, the growth was seen to have returned in the track of a tube which drained the bottom of the cavity left by the removal of the original tumor. Without delay it was cut down upon and scooped out, being as soft as cerebral tissue, and already containing small cysts. The part was then thoroughly cauterized with a strong solution of chloride of zinc (℥ i.–℥ i.). Twice within the next three weeks the growth returned and was destroyed with the same caustic application. Each time the chloride of zinc was used it left the ulcer, after the separation of superficial sloughs, covered with small healthy granulations, and with a marked tendency to contract.

About the middle of August the wound was all but healed, when a mass probably the size of a walnut was detected in the cicatrix. As the patient had lost not a little in health and strength by high temperature, suppuration, pain, and confinement to bed, she was advised to go to her country home, stay a few weeks, and return in better condition for another operation, which she accordingly did.

When, on the 13th of October, she returned after an absence of seven weeks, two tumors presented themselves in the gluteal region on the right side, encroaching upon the right lateral abdominal wall. The upper one had broken in two places where fungoid masses protruded; the lower one, as large as a fist, was ready to break. Posteriorly to them was an aperture made by one of the old cicatrices giving way, from which a serious hemorrhage had taken place eleven days before her return.

Oct. 18th, Dr. Briddon operated for the removal of the tumors. The incisions were made free and through sound tissue. Every suspicious part was cut out, even down to the bone (crest of ilium). No effort was made to close the resulting wound by suture; the whole surface, extending from the floating ribs to below the greater trochanter and backwards to within an inch of the median line, was treated by a thorough application of the chloride of zinc (℥ i.–℥ i.). After suppuration had become established the regular dressing consisted of lint spread with salicylic ointment and broad, adhesive straps to approximate the sides of the wound and (by their pressure) repress exuberant granulations. The patient's temperature after the operation ran on irregularly—generally above 102°.

In the early part of November her condition was complicated with a double pneumonia. A crisis came on the seventh day. While resolution went on rapidly on the left side the dulness on the right slowly and only partly cleared up. The changes in the lungs could not be closely followed because of the difficulty in moving patient, but were regarded as indicating secondary growths. The liver was now found greatly enlarged, probably also from multiple tumors. Patient soon required to be constantly under the influence of morphia. She became cachectic. Œdema appeared in her extremities, more pronounced on the right side.

By about the end of November the wound had contracted about one-third; the granulations upon its surface showed a constant tendency to become large and œdematous. For a time galvanic electricity was applied (the positive electrode upon wound) with the effect of relieving pain temporarily, inducing the growth of small granulations and stimulating contraction of the wound. But patient failed rapidly, and died (Dec. 7th) of extreme exhaustion.

At the autopsy (held thirty-one hours after death) the *heart* was found displaced to the left, its apex reaching the axillary line. Otherwise normal.

The *right lung* firmly adherent to the chest-wall at every point. It completely filled the right pleural cavity and encroached upon the left, pushing the heart before it and compressing the left lung. The right lung weighed 46 oz. The upper lobe in good condition; the lower lobes infiltrated and distended with a pultaceous substance.

Left lung adherent posteriorly. On the anterior surface of the lower lobe and between the lobes are adhesions of recent origin. The lung is diminished in size by compression. Lower lobe œdematous.

No infiltration of *bronchial glands*.

The parietal *peritoneum* on the right side at a place corresponding to the ulcer had evidently been acutely inflamed shortly before death.

The *Liver*, 6 lbs. 12 oz., extended entirely across the abdominal cavity and down below the level of the anterior superior spines of the ilia. In removing the organ it broke in several places, and a substance similar to that found in the right lung escaped.

The *Spleen*, 25½ oz., at its upper part was about normal in appearance; but in its lower half was enormously distended with some pulpy material. The other viscera are of no special interest.

Frozen sections of right lung. Liver and spleen are presented to the Society, illustrating in a most beautiful manner the multiple sarcomata of these viscera. Though six days have elapsed since death, the organs present the exact appearance they presented when removed from the body, the yellowish color of the neoplasms contrasting vividly with the surrounding healthy structure, and it is probable that in no other manner could the specimens have been preserved so as to illustrate the gross appearance as observed at the autopsy.

The tumors in the liver are more or less circular, circumscribed, and of a light yellowish or fawn color, that in the lung less circumscribed, in fact it appears to be infiltrated through the whole lower lobe.

The spleen has a very peculiar appearance. The upper two-thirds normal in form and structure; the lower third is expanded into a globular mass, about five inches in diameter. This tumor is darker in color than the others, stained and blotchy with hematine.

SARCOMA OF ARM—AMPUTATION AT SHOULDER-JOINT.

Dr. C. M. Allin presented a specimen of sarcoma of arm, for which amputation at shoulder-joint was performed with recurrence in the stump and secondary deposits. E. S., male, admitted to New York Hospital April 5, 1877, aged 23; Ireland; single; blacksmith. Family history good; previous health good; no history of injury to diseased arm, except that one day, while swinging the sledge-hammer, he felt a sharp pain midway between the shoulder and elbow. In December, 1876, nocturnal pain in right arm first noticed. This soon became continuous. In March, 1877, arm began to enlarge, and forearm and hand swelled. Examination reveals a hard tumor involving the upper end of the right humerus; skin dark purple; veins enlarged; radial pulse is full and strong; limb is the seat of numbness; no paralysis; the scapula moves with the humerus; no cachexia; no enlarged glands; right arm at axilla measures 17 inches; the left, in same place, 13 inches in circumference.—April 12th. Right arm, 18 in.; left, 12 in.—April 21st. Arm removed by me at shoulder-joint, which was not implicated in the new growth; veins much enlarged; growth was found to be periosteal, involving, however, the shaft of the bone to its lower fourth; wound was dressed with drainage tube, sheet-lint, and carbolized oil.—April 30th. Great pain; some discharge; one ligature came away.—May 4th. Two ligatures came away.—May 30th. Pain in hepatic region; can't draw a long breath.—June 5th. Small abscess opened just below the cicatrix.—June 21st. Painless enlargement appears below the glenoid cavity; yields only blood to the exploring needle.—July 5th. Tumor growing rapidly; begins to show granulations on its surface; another swelling has commenced lower down.—July 25th. Pain in left thigh: limb is enlarged and hard; has no heat or redness; the scapular tumor bulges out and presents a sloughy surface; odor foul; antiseptic dressings applied.—July 29th. Some blood and one ligature discharged; loss of appetite and emaciation set in.—Oct. 1st. Large fungoid mass springing from the glenoid cavity, 12 in. by 10 in.; its surface in some points covered by healthy looking granulation tissue, and at others by a grayish-black slough.—Oct. 20th. Died.—Autopsy, 13 hours post-mortem: Skin white; emaciation great; superficial abdominal veins very prominent; no bedsores. Only part of scapula not involved is a narrow margin at the posterior border; scapular muscles displaced and atrophied; clavicle and acromio-clavicular joint not implicated; no enlargement of the axillary or cervical glands. Internal mammary veins much enlarged; anterior mediastinal glands not enlarged; heart normal, firm; whitish clot in the right ventricle; pleuritic adhesions; no fluid; nodules on and in lungs of hard white substance, varying in size from peas to eggs; an immense deposit at the base of the right lung. Some fatty spots in the liver; all other viscera normal; mesenteric glands very numerous, enlarged and white. The sides of the lower lumbar vertebræ and both iliac fossæ are the seat of numerous hard tumors, some resembling enlarged glands, while others are more disseminated. One of these tumors pressed upon and was adherent to the inferior vena cava, which for a distance of two inches above and below was filled by a hard adherent thrombus. Thrombi extended into both iliac veins, and their branches completely closing them. Lumbar plexus was put on the stretch. Large hard tumor occupied the hollow of the sacrum on the right side, leaving just room for the passage of the rectum.

SARCOMA OF ULNAR NERVE ENDING IN AMPUTATION OF SHOULDER-JOINT AND EXSECTION OF SCAPULA.

Dr. Briddon, in connection with this case, referred to a similar one which had occurred to him fifteen years ago. The sarcoma involved the ulnar nerve. The first operation consisted in exsecting four or five inches of the nerve along with the tumor. In seven months the disease returned in the upper portion of the exsected nerve and extended in the course of its trunk to involve the soft tissues as high as the shoulder-joint. Amputation at that point was performed. She then entered the New York Hospital, the disease of course returning, when Dr. Parker exsected the bulbous nerves high up. A short time after this the disease reappeared at the seat of the last

operation, and Dr. Buck exsected the diseased portions, which consisted of the scapula and one-half of the clavicle. Returning again for the last time, the disease invaded the interscapular spaces, when operation was out of the question. Until the third operation the disease followed the course of the nerve. At no time did it invade the bone.

Dr. Sell referred to the case of sarcoma of the mamma which he had removed a few months ago. In a few weeks after the wound healed the disease reproduced itself in the cicatrix. The patient went to a cancer quack, who applied a caustic, and the resulting sore never healed. Death occurred suddenly.

Dr. Post presented a specimen of epithelioma of the upper lip, which he had removed by operation from a man aged 43 years, who, strange to say, had the disease for eighteen years. In order to fill up the gap occasioned by the operation, a flap was transplanted from the cheek.

Dr. Briddon performed a similar operation in that same locality. In the course of six months the disease returned.

NEW YORK MEDICAL JOURNAL ASSOCIATION.

Stated Meeting, December 21, 1877.

Dr. Robert F. Weir, President, in the Chair.

HYSTERIA.

Dr. Frank P. Foster read a brief paper upon the above subject, and the following points were noted. The convulsive form of the disease was not considered, because it was believed that it was already sufficiently well understood. Dr. Foster's own observation had brought him to the conclusion that well-marked globus was less frequent than most descriptions of hysteria would lead us to infer, while the reverse was true with reference to pain and syncopal symptoms. The doctor did not refer to seizures of true syncope, but to what might be termed attacks of *abortive syncope.* The prominent phenomena of such cases were as follows: The attacks were liable to come on suddenly, and in the presence of an assemblage of people, as at church, etc. Full loss of consciousness never occurred in the class of cases to which particular reference was made. If the person actually fell, which was a rare occurrence, she always was able to overcome the force sufficiently to call intelligibly for help. The fall might be prevented either entirely or partially by the force of the will. The patient usually complained of a feeling as if her heart was about to stop beating just before the attack. In exceptional cases there was a choreic form of twitching, always feeble, and never a tonic spasm.

In exceptional cases the phenomena were preceded by an aura.

PATHOLOGY OF HYSTERIA.

The pathology of hysteria had been a subject of considerable dispute. On the one hand it had been ascribed to the uterus entirely, and on the other it had been regarded as exclusively of neurotic origin. It was thought that probably the truth was between the gynecologists and the neurologists. Dr. Foster regarded hysteria as an abnormal condition of the nervous system in one or more parts, either inherited or acquired. The reason for its occurrence among females almost exclusively was because they had less physiological, and, in many instances, less volitional resistance than males.

Hysteria was more apt to be developed by slighter than by severer disease, and that disease was usually in the pelvic organs.

Well-marked hysterical symptoms, however, were sometimes relieved by emptying a distended colon; hence the conclusion that hysterical phenomena did not always depend upon uterine disease. Again, under the influence of some unusual stimulation the patient might make such an extraordinary exertion of the will as would enable her to overcome the symptoms.

TREATMENT OF HYSTERIA.

It was believed to be of the greatest importance to impress upon the mind of the patient the idea that there was no actual stigma attached to her illness. The patient's general nutrition should receive careful attention. Hysteria was not regarded as a disease which was in any way associated with luxurious living, for it was more prevalent among the poorer classes than among the rich. Hysterical patients should take nutritious food liberally, but only in such quantities as could be readily cared for by the stomach.

Alcohol was thought to be beneficial in one period or another during the course of the affection. It should not be given in doses sufficient to produce flushing of the face, etc. Cod-liver oil was serviceable. Arsenic was regarded as the most beneficial of drugs that could be employed in the treatment of this affection. For overcoming pain, electricity was mentioned as a most useful agent. The galvanic current was believed to be more efficient than the faradic. In the doctor's experience pressure over the ovaries did not produce any special benefit.

With reference to the question of marriage, it was thought that the cases were exceedingly few in which such advice was judicious. For if there was uterine disease present it was liable to be made worse instead of better by marriage; and with reference to the question of benefit following the gratification of sexual desire, it was believed that it had no foundation in fact.

Dr. Peaslee remarked that he agreed with the writer of the paper in the statement that the pathology of hysteria was not well understood. He was of the opinion, however, that in the present state of gynecology we had a right to believe that if one organ or set of organs were responsible more than any other for hysterical symptoms, those organs were the ovaries. With regard to the phenomena of hysteria, it was well known that hysterical symptoms were developed in the male such as could not be distinguished from those manifested by the female. Again, the exclusive view that hysteria always depended upon the uterus or ovaries was not correct, because the phenomena of the disease might be developed in girls before puberty, and also in boys. If, however, the subject was confined to women, and to women between the ages of fifteen and forty-five—hysteria was not often met with before or after the cessation of menstruation—it was believed that the ovaries were responsible almost always, and the uterus almost never. In other words, it was safe to say, as a general proposition, that hysteria was always ovarian and never uterine. But it was to be remarked that it was not the grave affections of the ovaries which produced hysterical symptoms; the disease of the ovaries was always of the slighter degree. Acute inflammation of the ovary did not produce hysteria, but congestion of the ovary produced it constantly in a certain class of women.

Here, again, we were obliged to make a restriction, for there were certain women who never had hysteria under any circumstances. The disease, therefore, was

restricted very nearly to that class of women who had what might be called the "ovarian temperament," and it occurred with the slighter degrees of ovarian trouble. In that class of females the slight derangement incident to congestion of the ovaries usually gave rise to an explosion of hysteria; but if the same woman should have acute inflammation of the ovaries, one or both, there was no more hysteria until they got better, when the hysteria would probably return. Hysteria, then, was a symptom produced by congestion, or by some minor degree of disturbance of the ovary. Again, if the woman who was inclined to be hysterical became pregnant, there was usually no hysterical manifestations during the last half of the term. That was true as a general proposition, but there were exceptions. Therefore, when we came to the treatment of hysteria, our attention should be directed to the ovaries more especially than to the uterus.

With reference to telling the woman precisely what was the matter with her, if we had to deal with a patient who had suffered from ovarian irritation for a long time, and had been educated wrongly upon the subject of hysteria; that is, had been led to believe that it was about the most discreditable thing that could happen to have an attack, if such a woman was told exactly what her ailment was, the effect would probably be to make her an enemy for life, and at the same time, in all probability, to cure her of her hysteria. Dr. Peaslee had cured about ten cases in that manner, but they were chronic cases, and the women understood perfectly well their own condition.

In ordinary cases it was proper to tell the woman kindly that she was hysterical, that there was a cause for it, that the best thing possible would be done with a view to its complete removal, and thus endeavor to remove the source of the disagreeable symptoms.

Dr. Peaslee would not advise a woman to marry with reference to the gratification of sexual excitement; but it was probable that if a woman became married her surroundings and occupation would be changed, and her attention would be drawn from herself. There were cases in which he would advise a delay of marriage; such cases, for example, as those in which chronic congestion of the ovaries existed.

But there was another question to be considered with reference to marriage: if the woman's ovaries were not so injured but that conception might occur, marriage might be beneficial. For in that way a rest of nearly two years could be secured for the ovaries. In certain cases, therefore, marriage might be of the utmost importance, and, if there was no objection, should be recommended.

DR. WEIR inquired of Dr. Gibney if he had seen hysteria associated with diseases of the joints.

DR. GIBNEY replied that he had, and especially in connection with knee-joint disease occurring in girls.

DR. WEIR remarked that Dr. Gibney's experience was a confirmation of his own; that he had quite frequently seen hysterical symptoms in connection with joint diseases occurring in women, and at the same time associated with more or less ovarian irritation. Hysterical phenomena might also occur in men who suffered from joint disease.

DR. PEASLEE inquired with reference to the joints which were most commonly affected when hysterical symptoms were developed.

DR. WEIR replied that he had seen it most frequently in connection with disease of the knee and ankle-joints, and that he had usually succeeded in controlling the symptoms by exercising his own will-power over the patient; supplementing such influence, of course, by a more or less general tonic treatment, and also by local treatment.

A vote of thanks was extended to Dr. Foster for his paper, and the Association adjourned.

NEW YORK NEUROLOGICAL SOCIETY.

Stated Meeting, January 7, 1878.

DR. E. C SEGUIN, PRESIDENT, IN THE CHAIR.

PECULIAR MARKINGS OF MEDULLATED NERVE-FIBRES.

DR. J. C. SHAW exhibited prepared specimens of nerve-fibres from the frog, which showed peculiar oblique, sharp-edged, feathery markings in the myeline. Dr. Shaw regarded them as entirely artificial, and independent of the constrictions of Ranvier. They were believed to be artificial because the markings were not always in the same direction as Ranvier's constrictions, and because the markings were not always of the same character; in some instances they were much more sharply defined than in others. His method of preparation was as follows:—Remove the nerve as rapidly as possible from a frog or dog, place it in a 1 per cent. solution of hyperosmic acid for twenty minutes; then wash carefully, and afterwards tease small portions in glycerine.

DR. SEGUIN inquired whether the freshness of the nerve-fibre, or the species of animal, in any way influenced the appearance of these markings?

DR. SHAW replied that he had examined nerves removed from various animals, and that the markings had been seen in each instance with the same facility. He had also made examinations of nerves while *in situ*, but had found that if the nerve was removed rapidly, the fissures or markings showed as distinctly as when the nerve was attached to the body of the animal.

In reply to a question by DR. SPITZGA, Dr. Shaw remarked that he believed the markings or fissures were due to the astringent effect of the osmic acid upon the myeline as it coagulates.

DR. SESSLE had observed these markings upon nerve-fibres, and regarded Ranvier's constrictions as artificial, and these as natural. According to his observation, the markings were seen better in the fresh than in other nerves. His examinations were made in aqueous humor and only slightly teasing the nerve. He regarded these oblique markings as part of the lymphatic spaces about nerves, and had seen the formation of Ranvier's constrictions by a gradual disappearance of the sharp corners of the outlines of the fissures.

DR. SEGUIN inquired of Dr. Sessle how he would account for the regular distances at which Ranvier's constrictions were situated, in proportion to the size of the animal, if they were artificial?

DR. SESSLE replied that the distance between the breaks might be farther in human nerves than in nerves taken from the lower animals, consequently the constrictions would be unequally distant in different animals.

DR. SHAW remarked that the fissures or markings were at a varying distance from each other in different specimens from the same animal.

DR. SEGUIN had teased in serum the extremity of a nerve still attached to the body of a frog, and had always found the constrictions of Ranvier present, but had not always seen the oblique, feathery markings under consideration.

A CASE ILLUSTRATING POINTS IN THE HISTORY OF TRAUMATIC FACIAL PARALYSIS, AND ALSO BEARING UPON THE PATHOLOGY OF MÉNIÈRE'S DISEASE.

DR. SEGUIN presented a patient and read the history of the case as reported in the MEDICAL RECORD for

Sept. 2, 1876, p. 586—"*Neurosis of Internal Ear from Chronic Suppuration of Middle Ear.*" Judging from the size of the portion of bone and the locality from which it was removed, it was believed to be altogether probable that there was laceration of the *portio dura*. On the other hand, it seemed almost incomprehensible that so large a nerve as the facial should recover its function when once destroyed. But in this boy, after a lapse of less than one year after the escape of the bones (the cochlea and the semicircular canals), and in less than two years after the beginning of the facial paralysis, there was the beginning of pretty good recovery. The case also threw some doubt upon the accepted pathology of Ménière's disease, viz., impairment of the function of the semicircular canals.

Again, it threw some doubt upon the theory that the integrity of the semicircular canals was necessary to the maintenance of the proper equilibrium of the body.

Remarks were made by Drs. Putnam-Jacobi, Spitzga, Seguin, and others.

TROPHIC DISTURBANCES IN INSANITY.

Dr. James G. Kiernan read a paper upon the above subject, in which he considered a number of trophic disturbances, such as hæmatoma of the ear, of the intestines, etc., discoloration of the skin, condition of the hair, enlargement of the thyroid gland, arthropathies, etc.

NEGATIVE RESULTS FROM ADMINISTERING BROMIDE OF POTASSIUM TO THE INSANE.

In the course of his paper, Dr. Kiernan incidentally remarked that he had given as high as *half an ounce* of bromide of potassium daily to insane patients without producing any noticeable effect, either sedative or in the way of producing acne.

Dr. Spitzga did not regard the electrical condition of the hair in the insane as a trophic disturbance, but that it was due rather to the action of the *arrectores pili*.

The paper was discussed by Drs. Seguin, Putnam-Jacobi, Spitzga, Sessle, and others.

The Society then adjourned.

MEDICAL SOCIETY OF THE COUNTY OF NEW YORK.

Stated Meeting, January 28, 1878.

Dr. John C. Peters, President, in the Chair.

MEMORIAL OF DR. E. R. PEASLEE.

Dr. T. Addis Emmet read a memorial upon the late Dr. E. R. Peaslee, the skilful physician and surgeon, the learned and conscientious man. Dr. Peaslee had died in consequence of overwork, the very thing against which his warning voice was heard only a few weeks previous, when speaking of the death of the late Dr. A. B. Crosby.

MEMORIAL OF DR. JOS. WORSTER.

Dr. Salvatore Caro read a memorial upon the late Dr. Joseph Worster, in which a fitting tribute was paid to the deceased. The memorial was accompanied by resolutions, which were unanimously adopted by the Society.

THE MARTYRS OF FERNANDINA.

Dr. J. A. Wyeth read a memorial of Dr. Preston Welford, of Fredericksburgh, Va., and Dr. J. C. Herndon, of Savannah, Ga., who responded to the call for aid, and lost their lives in the epidemic of yellow fever at Fernandina, Fla., in 1877.

CERTIFICATES OF MEMBERSHIP.

It was voted, on recommendation of the Comitia Minora, to grant certificates of membership to Drs. Julius Scheider, M. J. De Rosset, M. Donnelly, J. H. Gunning, D. Bryson Delavan, J. W. Hupfield, W. K. Newton, E. C. Seguin, Montello Cristofero, R. M. Fuller, N. E. Crampton, R. A. Caldwell, J. Phillips, and Gustave Minnaillo.

The paper of the evening was read by Dr. J. W. S. Arnold, and entitled:

"An experimental inquiry into the muscular element of the first sound of the heart."

Correspondence.

"HOW TO SUPPRESS QUACKERY."

To the Editor of The Medical Record.

Dear Sir:—I wish to add an endorsement to certain practical suggestions, in the letter of Dr. G. M. Schweig in the Record of Jan. 19th, concerning the need which exists of furnishing to the community some authoritative information about the standing of its medical men.

While there is, without doubt, an inherent tendency toward quackery among people generally, which no amount of education can wholly overcome, yet unquestionably irregular and unqualified practitioners are often employed, only because the public has no ready means of distinguishing them from physicians in good standing.

I have met with cases to illustrate this over and over again, as has probably every one in active practice.

We, as physicians, are, from association and frequent discussion, so familiar with the more important points of medical ethics, like this of advertising, that I suspect we oftentimes do not realize how little they are understood, outside of the profession, even among well-informed people.

I had this brought forcibly to my mind during an after-dinner conversation some time since, in this wise.

Some medical topic was under discussion, and in speaking of it, I casually alluded to the fact, which I supposed was generally understood, that in New York and other cities in this country, if a doctor advertised himself in a newspaper, it was *prima facie* evidence that he was not a regular physician.

There were five or six gentlemen present, all of whom were above the average in culture and intelligence, but to my surprise only one of the number was aware that there was such a rule, and there was decided interest taken in my reiterated statement that such was certainly the case.

It seems to me, then, that if people of education can know so little of the subject, there must be a lack of information throughout the community, which we owe it to ourselves and to our profession to do away with.

As to the best means of effecting this, there will probably be differences of opinion.

The essential point seems to be, that in a city like New York, for example, a standing notice should be published in the leading newspapers, by authority of the County Medical Society, stating, in substance, 1st, That no physician in good standing advertises himself in a newspaper, or in any other manner, it being considered derogatory to self-respect, and a violation of the code of medical ethics. 2d (as is suggested by Dr. Schweig), That the Medical Register, contain-

ing a list of all New York physicians in regular standing, can be seen at any prominent drug store.

There are so many objections to the publication of a list of approved advertisements, as recommended by Dr. S., that I cannot believe that the proposal will find general favor, and it appears to me unnecessary to the object in view—that is, to furnish the public with a ready means of discriminating between regular physicians and quacks.

I remain very truly yours,

G. W. MURDOCK, M.D.

COLD SPRING, N. Y., January, 1878.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—I read with surprise in your issue of Feb. 2d a communication modestly signed "Reformer." As a mere attempt to ventilate sarcasm, the article in question may or may not be a success; of this I will leave others to judge. As an attempt, however, to ridicule what is really a most important matter, that should, whether *pro* or *con*, be only seriously argued, it is, as I shall show, signally unsuccessful. I should not have noticed it at all, were it not calculated to mislead some who, perhaps, have given my own communication but a superficial perusal. To be brief, "Reformer" makes statements that are entirely fanciful and utterly at variance with the measures I advocate. A reference to my first communication will show that I distinctly stated that advertisements in the case of the general practitioner should contain no more than is on the business card of most physicians, *i.e.*, name, address, hours. In the case of the specialist, the simple addition of his specialty, *without any special inducements*. As it was, moreover, my suggestion that the entire matter should be under control and supervision of the County Medical Society, the possibilities held out by "Reformer" are simply an implied doubt of the capacity or willingness of that organization to keep advertisements within proper bounds.

I had thought, Mr. Editor, that I had made my meaning clear enough in my former letter. As it is, I am always cheerfully ready to make things, if possible, even more intelligible, although I believe a careful reading of my letter ought to leave nothing to explain.

GEO. M. SCHWEIG, M.D.

PROPRIETARY MEDICINES.

TO THE EDITOR OF THE MEDICAL RECORD.

DEAR SIR:—Will you favor me with an opportunity to correct a mistake of one of the gentlemen of the N. Y. State Society in a discussion which is related upon page 78 (third paragraph, first column), No. 377, issue of Jan. 26, 1878, of THE MEDICAL RECORD?

Dr. Squibb is in error about "*bromo-chloralum*" ever having been recommended or even mentioned in a paper on the treatment of diphtheria read before the State Society two years ago.

I can speak with absolute certainty that, except as to the trade name, as published in the drug market, *bromo-chloralum* is entirely unknown to the author of the paper alluded to by Dr. Squibb. For the first time in two years Dr. Squibb has inadvertently betrayed the error under which he has been laboring with regard to the pharmaceutical preparation which really was approved in that paper.

GEO. BAYLES, M.D.

37 W. 46TH ST., NEW YORK CITY, Jan. 26, 1878.

THE HOSPITAL STEWARDS, U. S. ARMY.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—Permit me to thank you on behalf of the Hospital Stewards of the army who are specially interested in the "proposition" to which you so ably, justly, and accurately allude in your issue of January 5th. The stewards owe a debt of gratitude to you for your defence of their cause.

I would beg leave to say, through your favor, that, as we do not wish that there should be any uncertainty about the definition of rank, an *amended* "proposition" has been submitted to the higher authorities, asking that clause 2 read: "1st Class Medical Steward, U. S. A., with rank of *Staff* Sergeant-Major, U. S. Army, but to take place next below the Post or Battalion Sergeant-Major at reviews, inspections, or parades of troops" instead of "Regimental" Sergeant-Major. Trusting you will pardon my troubling you thus, I remain, sir, very respectfully,

Your obedient servant,

HOSPITAL STEWARD, U. S. A.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from January 27 to February 2, 1878.

WATERS, W. E., Captain and Asst. Surgeon. Assigned to duty as Post Surgeon at San Antonia, Texas, and as Attending Surgeon during illness of Asst. Surgeon Taylor. S. O. 17, Dept. of Texas, January 23, 1878.

PAULDING, H. O., 1st Lieut. and Asst. Surgeon. Leave of absence extended three months. S. O. 19, A. G. O, January 26, 1878.

TURRILL, H. S., 1st Lieut. and Asst. Surgeon. Relieved from duty as Post Surgeon at San Antonio, Texas. S. O. 17, C. S., Dept. of Texas.

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachms
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its present sale exceeds $100,000 per year at wholesale. Its almost universal adoption by the profession, as the above figures show, is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK's preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proven itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

NEW YORK, *April 6th*, 1875.

J. R. LEAMING, M.D.,
Attending Physician at St. Luke's Hospital.

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

PURE COD-LIVER OIL.

Manufactured on the Sea-Shore by HAZARD & CASWELL, from Fresh and Selected Livers.

The universal demand for Cod-Liver Oil that can be depended upon as strictly pure and scientifically prepared having been long felt by the Medical Profession, we were induced to undertake its manufacture at the Fishing Stations, where the fish are brought to land every few hours, and the Livers, consequently, are in great perfection.

This Oil is manufactured by us on the sea-shore, with the greatest care, from fresh healthy Livers of the Cod only, without the aid of any chemicals, by the simplest possible process and lowest temperature by which the Oil can be separated from the cells of the Livers. It is nearly devoid of color, odor, and flavor—having a bland, fish-like, and, to most persons, not unpleasant taste. It is so sweet and pure that it can be retained by the stomach when other kinds fail, and patients soon become fond of it.

The secret of making good Cod-Liver Oil lies in the proper application of the proper degree of heat—too much or too little will seriously injure the quality. Great attention to cleanliness is absolutely necessary to produce sweet Cod-Liver Oil. The rancid Oil found in the market is the make of manufacturers who are careless about these matters.

Prof. PARKER, of New York, says: "I have tried almost every other manufacturer's Oil, and give yours the decided preference."

Prof. HAYS, State Assayer of Massachusetts, after a full analysis of it, says: "It is the best for foreign or domestic use."

After years of experimenting, the Medical Profession of Europe and America, who have studied the effects of different Cod-Liver Oils have unanimously decided the light straw-colored Cod-Liver Oil to be far superior to any of the brown Oils.

COD-LIVER OIL, with IODINE, PHOSPHORUS, and BROMINE.—This combination represents Phosphorus, Bromine, Iodine, and Cod-Liver Oil in a state of permanent combination, containing in each pint: Iodine, eight grains; Bromine, one grain; Phosphorus, one grain: Cod-Liver Oil, one pint.

COD-LIVER OIL, with PHOSPHATE OF LIME.—This is an agreeable emulsion, holding three grains Phosphate of Lime in each tablespoonful.

COD-LIVER OIL, with LACTO-PHOSPHATE OF LIME.

IODO-FERRATED COD-LIVER OIL.—This combination holds sixteen grains Iodide of Iron to the ounce of our pure Cod-Liver Oil.

JUNIPER TAR SOAP.—Highly recommended by the celebrated ERASMUS WILSON, and has been found very serviceable in chronic eczema and diseases of the skin generally. It is invaluable for chapped hands and roughness of the skin caused by change of temperature. It is manufactured by ourselves from the purest materials, and is extensively and successfully prescribed by the most eminent physicians.

FLUID EXTRACT COCA.

NERVINE, STIMULANT. USED IN PERU and BOLIVA as a MASTICATORY.

This Extract contains the entire properties of the leaf of the **Erythroxylon Coca.**

COCA WINE.

This Wine has been successfully used in France as a **tonic**, and found very desirable where a more mild effect of the Coca than the Fluid Extract was desired.

SOLUTION FERROUS CHLORIDE.

This Solution of Iron is the lowest form of Chloride. It is much less Styptic in taste than Tr. Iron Chloride, consequently pleasanter to the patient; is much more easily assimilated by weak and irritable stomachs.

Knowing how difficult it is to introduce into the blood, in a proper form, a sufficient quantity of iron to be beneficial, we have manufactured and introduce the **Ferrous Chloride** as being easily absorbed and acting with much efficacy, even when given in small doses.

RELIABLE ANIMAL VACCINE.

The undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*
This Animal Vaccine can be obtained at CASWELL, HAZARD & Co's., Broadway, cor. 24th Street.

FRANK P. FOSTER, M.D.

We have an arrangement with Dr. Foster by which we receive this Vaccine *fresh daily.*
By this arrangement all supplied by us *is absolutely fresh.*
We can furnish it in any quantity desired, either by express, or by mail, if remittance is made to cover postage.
Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified indorsement of the medical profession of New York

QUILL SLIPS (half quill, charged on convex surface, at square-cut end),	$0.25
CAPILLARY TUBES, ...	2.00

SURGICAL INSTRUMENT DEPARTMENT,

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast.

and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

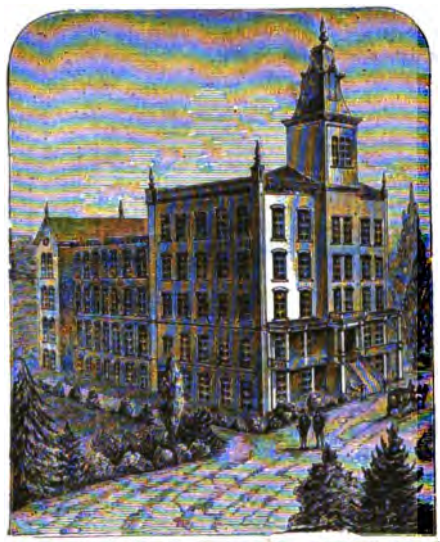
In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*

Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York**, will receive prompt attention.



THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.

INCORPORATED 1866.

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors; billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton [L. I.], N. Y.

CAUTION!!—SPECIFY McKESSON & ROBBINS'.

THERAPEUTICAL NOTES ON SOME SPECIALTIES IN McKESSON & ROBBINS' G. C. PILLS.

ERGOTIN PILLS, ... 3 grs.

We manufacture our Ergotin with great care from the best quality of fresh, selected Ergot, and it contains, in the most potent form, all the active constituents of Ergot of Rye, each grain representing 10 grains of Ergot, and each pill being equal to half a teaspoonful of officinal fluid extract. The value of Ergotin, in the place of the crude drug and the fluid preparations, is conceded; and it is being largely administered both in this country and in Europe. It has taken a prominent place in the treatment of Neurotic diseases. Many of our most reliable practitioners, and particularly those of extended experience in Gynæcology, assert that they have never found a preparation of Ergot, in which, by experience, they felt as much confidence as in McKesson & Robbins' Ergotin Pills. The advantages of prescribing it in this form will be readily acknowledged. (Dose, 1 to 3.)

We offer our Ergotin, prepared specially for hypodermic use, in one-ounce bottles.

COCA EXTRACT, ... 1 gr.

McKesson & Robbins' Solid Extract, made from freshly imported leaves, is used in these pills. As the leaves become almost inert with age, a preparation of this nature is necessary to enable the physician to judge correctly of the value of this remedy. Coca Erythroxylon is a South American plant, used by the natives as a substitute for tea, coffee, tobacco, hashish and opium of other countries. It imparts vigor to the muscles as well as to the intellect, and enables the partaker to endure great fatigue with ease. The feeling of exhilaration, accompanying its use, is said not to be followed by any depressing effects.

JABORANDI EXTRACT, ... 3 grs.

Made of McKesson & Robbins' Solid Extract. These pills present a much better and more acceptable form of administering this powerful Diaphoretic and Sialagogue, than any of the liquid preparations. Valuable in Rheumatism and all Syphilitic troubles of long standing. (Dose, 1 to 3.)

PHOSPHIDE ZINC, ... 1-6, 1-4 and 1-2 gr.

The Phosphide of Zinc has been very successfully used by Drs. Hammond (see Dr. H.'s last book), Routh, and other prominent authorities on treatment of brain diseases, all of whom assert its efficacy. It has been used with remarkable results in severe cases of Neuralgia (see paper by Dr. Adolphus, St. L. Med. Jour., XIII. 471). P. Vigier, *Bull. Gen. de Therap.*, states that Phosphide of Zinc is more prompt and reliable in its action than free Phosphorus.

SANDAL WOOD EXTRACT, ... 1 and 2 grs.

These pills contain both the oil and resin existing in Sandal Wood, are believed to be superior to the oil alone, and are more convenient of administration. The Extract is manufactured from the wood, in our laboratory.

SOLIDIFIED COPAIBA, WITH OLEO-RESIN CUBEB PILLS, ... 3 and 5 grs.

We prepare both these ingredients in our own laboratory, with great care, and can assert their superior quality. The value of the Oleo-Resin Cubeb often offered in market is very slight, due to the fact that the largest proportion is powdered Cubeb Berries.

QUININE, SULPHO-CARBOLATE, ... 1, 2 and 3 grs.

This salt of Quinine has been very much used in some of our extreme malarial districts during the past two years. Those, who have tested it very carefully, claim that it possesses a most positive specific action in the treatment of Fever and Ague, and has proved itself eminently superior to the Sulphate of Quinine in all malarial fevers

PHYSICIANS' POCKET CASES FOR PILLS.

Having received many inquiries for our Gelatine-Coated Pills and Granules put up in a form convenient for practitioners, and, not finding any of the ready-made pocket cases in market desirable, we have devised a number of forms and sizes of our own. The number and variety of the formulas of our Pills, together with their ready solubility have, to a great extent, obviated the necessity of carrying the bulky medicine chest, with its solution and powders.

Circular, with cuts and prices, mailed upon application.

CAUTION!!—SPECIFY McKESSON & ROBBINS'.

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist,

Explanatory Circular mailed on application.

EASTERN DISPENSARY—VACCINE DEPARTMENT.

PURE BOVINE (ANIMAL) VIRUS.

This Virus is the result of a continued reproduction from the famed Beaugency stock, propagated under our own immediate supervision at Pearl River, N. Y. It is furnished at the following reasonable

SCALE OF PRICES:

One Quill Slip,	**$ .25**	**Fluid in Capillary Tube,**	**$1.00**
Seven Slips,	**1.00**	**Three Tubes,**	**2.00**

N.B.—Each tube will vaccinate from five to ten persons.

Concrete Vesicle—i. e., Crust or Scab, $1.00 to $3.00, according to size.

HUMANIZED VACCINE VIRUS constantly on hand, as heretofore, at same rates as above.

We guarantee success with 95 per cent. of Quill Slips, and, if used with due care and within one week of reception, will duplicate all failures.

AUGUSTUS W. WEISMANN, *Chair. Vac. Com.*

Address, **S. S. BOCERT, M.D., Eastern Dispensary,**

57 Essex Street, Station B, New York City.

Peck's Cod-Liver Oil and Wild-Cherry Bark.

Unequalled for rapid and efficient action in **Phthisis, Deficient Nutrition,** etc. Agrees with the most delicate stomach, never causes eructations, is a positive tonic. Its taste is far more agreeable than that of any other combination. It is a perfect emulsion of fifty per cent. of oil and twenty-five per cent. of bark, from which the oil does not separate, and which keeps indefinitely without change.

Dr. W. L. ATLEE, Jr., Philadelphia, writes:—"I have used your Ol. Morrh. cum Prun. Virg. in upwards of a hundred cases. The results were invariably satisfactory and very much better than I ever obtained with other preparations of Cod-Liver Oil."

Peck's Elixir of Phosphorus.

For **Paralysis, Melancholia, Lapse of Memory,** etc. **A powerful Aphrodisiac.** A clear, permanent, palatable solution, containing $\frac{1}{100}$ gr. unaltered Phosphorus in each teaspoonful.

Sold by apothecaries generally.

H. T. PECK & CO., Chemists, Philadelphia.

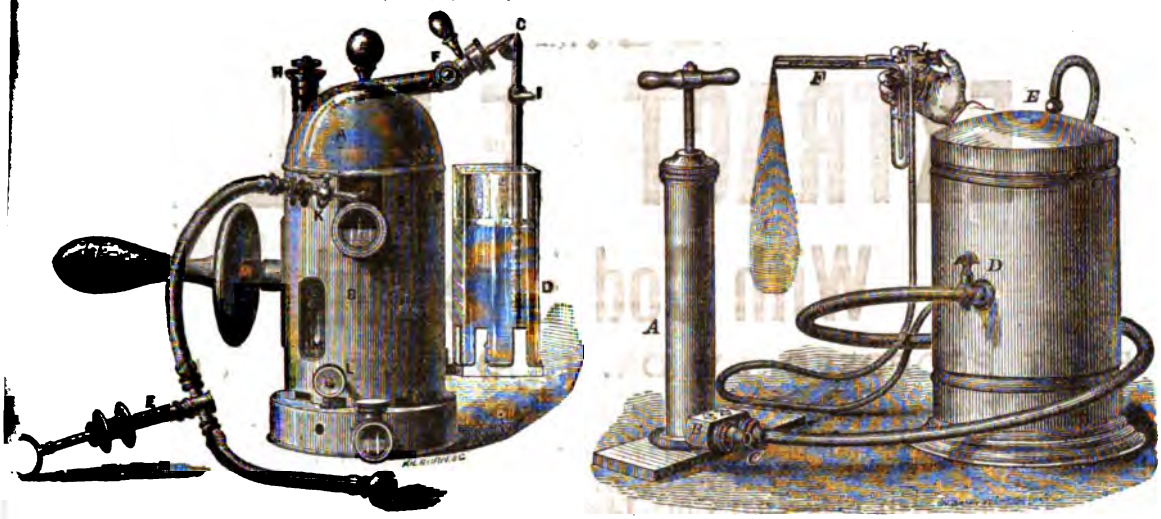
THE ANTISEPTIC ATOMIZER.



In this apparatus we have incorporated some of the best features of the Atomizing Apparatus heretofore made by us, already familiar to the profession. It is of best materials and workmanship—strong, durable, convenient, easily regulated, and by means of a new attachment of our own design, adequate without cessation of spray for any operation, or series of operations, however extended. Full description on application.

A NEW PAMPHLET

On Atomization of Liquids, with Formulæ of many articles of the Materia Medica successfully employed in the practice of a well-known American Practitioner, together with a description of the best forms of apparatus, will be sent post-paid on application. Also our new illustrated Catalogue of Surgical Instruments.

ATOMIZING APPARATUS BY COMPRESSED AIR.

This apparatus will be found entirely satisfactory on account of its elegance and perfect working qualities. It has a double acting Brass Pump (condensing or exhaust, at will), with valves unchangable by time or use. Strong Copper Receiver, Nickel Plated, 12 feet, light and flexible but strong; brown-colored Tubing and a self-closing cut-off (our own design, represented at I), readily connected with any tubes now in use.

PRICES REDUCED.

The Complete Atomizer	**$5.00**	**Clarke's Atomizer**	**$3.00**
Dr. Oliver's "	**4.00**	**The Constant "**	**3.00**

CODMAN & SHURTLEFF,

MAKERS AND IMPORTERS OF SUPERIOR SURGICAL INSTRUMENTS,

13 & 15 Tremont Street, BOSTON.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of 1-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

Added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians referring to it in terms of high praise.

ANNOUNCEMENT.

Over 200 pages additional Reading Matter in a year, with no change in price, making two royal octavo volumes of 520 pages each.

THE MEDICAL RECORD.

A Weekly Journal of Medicine and Surgery.

Edited by GEORGE F. SHRADY, A.M., M.D.

The publishers have the pleasure of announcing that, beginning with the first number for January, 1878, THE MEDICAL RECORD will be enlarged by the addition of *four pages* each week, amounting to

OVER 200 PAGES ADDITIONAL READING MATTER

In a year—with NO CHANGE IN PRICE. This very great increase in the size of the journal has been rendered possible by the large advertising patronage enjoyed by it, and is a direct benefit to subscribers from this source. An increased number of advertising pages never costs subscribers any thing, never encroaches upon the reading matter, which is invariably the same each week, and should always be viewed by readers with satisfaction, as an evidence of the prosperity of the journal, and its greater ability to provide for them.

"THE MEDICAL RECORD"

For 1878 will, therefore, consist of TWO ROYAL OCTAVO VOLUMES of 520 pages each. Subscription price, $5.00 per year, *invariably in advance.*

The Volume commences January 1st.

This Journal, now in its thirteenth volume, is published on Saturday of each week; each number consists of twenty super-royal octavo pages, double columns, and contains Original Articles from the first men of the country in their respective departments, Reports of Lectures, Societies, and Hospital; an account of the Progress of Medical Science throughout the world; Editorial Articles on Current Topics of Interest, Reviews and Notices of Books, Correspondence, New Instruments, Medical News and Items, &c., &c.

It is the only WEEKLY MEDICAL JOURNAL published in NEW YORK.

The Medical Record is intended to be thoroughly Cosmopolitan in its character, representing the interests of the profession in all parts of the country. It is entirely independent of all parties or cliques. Its object is to present to the profession a faithful record of the existing state of medical science in all its departments; and, as it is more especialy intended to meet the wants of the general practitioner, the articles published in its columns are thoroughly practical in their character.

SPECIMEN COPY SENT FREE.

An increase of 200 pages additional Reading Matter in a year will be made in

THE AMERICAN JOURNAL OF OBSTETRICS

And Diseases of Women and Children.

PAUL F. MUNDÉ, M.D., Editor.

In consequence of the great increase in the number of subscribers to the AMERICAN JOURNAL OF OBSTETRICS the past year or two, the Publishers take pleasure in announcing that, beginning with January, 1878 (Vol. XI., No. 1.), they will permanently increase each number by *fifty additional pages*, thus giving its subscribers annually about

ONE-THIRD MORE READING MATTER

than heretofore, or, a volume of 896 large octavo pages with *no change in the subscription price.*

An increased number of illustrations, both wood engravings and lithographed plates, may also be expected in future volumes.

While the prosperity of the AMERICAN JOURNAL OF OBSTETRICS, and this consequent substantial evidence of it, cannot fail to be gratifying to all its subscribers and other friends, the Publishers trust the Medical Profession will take this voluntary action on their part as an earnest of their desire and intention, so far as in their power, to make all their publications merit the liberal support which is given them.

Subscription Price, $5.00 per year, invariably in advance.

☞ If any subscriber has a friend to whose notice he would like to commend the Journal, the Publishers will be pleased to mail a Specimen Copy to any address furnished them.

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

THE TWO JOURNALS WILL BE SENT FOR NINE DOLLARS A YEAR.

In corresponding with Advertisers please mention **The Medical Record**

THE BEST THAT CAN BE PRODUCED

At Lowest Prices for Prompt Cash,

We are, therefore, fitting all our Physicians' vehicles and other fine carriages with

THE RUBBER CUSHIONED AXLE.

This great improvement secures the essential objects sought for in every vehicle, viz., **SAFETY, COMFORT,** and **ECONOMY,** and its use indisputably assuring these important and valuable qualities, it is now accepted as an

INDISPENSABLE FEATURE

In carriage building wherever **PERFECTION,** or a near approach to it, is sought to be attained.

Axles in use, where the arms are not much worn, can be altered, using the same wheels if the hubs are sound. Those at a distance may have the alterations made by sending us the axles and wheels only.

SEND FOR ILLUSTRATED CATALOGUE AND PRICE LIST.

HARNESS for PHYSICIANS' USE.

Please mention this Journal.

TO PHYSICIANS.

A large number of the profession in this and other cities now using the

RUBBER CUSHIONED AXLE,

And in some instances, for more than two years, accord it their unqualified endorsement as a means of obtaining relief from the discomfort and fatigue experienced when riding much, or at long distances.

Muffling noise and **rattle, preventing violent dilation of the springs** whereby **motion is lessened, decreasing vibration, jolting** and **pounding, economizing wear** and **tear** at every point, especially upon the wheels, reducing repair bills fully 50 per cent., renders this

APPROVED INVENTION

of the greatest value to all who would ride with **increased safety, absolute comfort, saving money** at the same time.

The improvement is simple in construction and easily applied. The expense is quite insignificant when compared with the gain, not only in largely increased durability of the vehicle, but in horse-power also, traction being reduced from 17 to 25 per cent.

Should your carriage builder be unfamiliar with the mechanical principle of "the axle," or the manner of its application, please send us his name and address, which will receive prompt attention.

By permission, we refer to the following well-known gentlemen now using the "Rubber Cushioned Axle," and, with two exceptions, for periods exceeding fifteen months:

Dr. Edward Bayard, 8 West 40th Street.
Dr. H. P. Farnham, 138 West 23d Street.
Dr. G. A. Peters, 12 West 29th Street.

LEUBE'S MEAT SOLUTION.

Freshly prepared, in one pound glass jars always on hand.

For formula and use see Ziemssen's "Cyclopædia of the Practice of Medicine," Vol. 7, page 226; and Vol. 12, Special Note before Table of Contents; and N. Y. MEDICAL RECORD, Jan. 19, 1878, page 58.

"Of all the meat-preparations the *only reliable* one is Leube's Solution, made by Hoffmann's Formula."
—Dr. E. R. PEASLEE, *Proceed. N. Y. Acad. Medic., Dec.* 20, 1877.

As the Meat Solution does not keep long, its freshness can only be guaranteed by ordering *direct from the manufacturer*. Orders by postal-card or telegraph promptly attended to.

FRED. HOFFMANN, Apothecary and Chemist, Sixth Ave. & 45th St., N. Y.

'BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end), *90 cents*
Seven " " " " " $1.00.
Crusts, each (Hermetically Sealed), ... *2.00.*

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of information may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free.

A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases—such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine Camphor, Gums, Resins. For general purposes it is fluid at 87° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

Fee for the whole course, $30; for each course taken separately, $10.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of **CASWELL, HAZARD & CO., New York**, and of all respectable Chemists throughout the world.

LAZELL, MARSH & GARDINER'S POWDERED MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts*.

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz.		per oz.

W. J. Haine, Farmington, Ohio.	Robt. Wadsworth, Rochester, N.Y.
H. C. Hill, Somerset, N. Y.	J. J. Williams, New York City.
W. P. Worster, New York City.	

Printed Pills and Granules

These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the perfection of **accuracy**, and a **safeguard against mistakes or substitution**. Their claim to the confidence of the medical profession and pharmacists rests on the entire purity of the ingredients used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal: Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

FOOD IS THE BEST TONIC!!

MENSMAN'S

PEPTONIZED

BEEF TONIC.

TRADE MARK.

The great necessity for a fluid food that would possess **all the elements necessary for the support of the system**, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared after a thoroughly tested and scientific method.

PROPRIETORS,

CASWELL, HAZARD & CO.,

DRUGGISTS AND CHEMISTS,

SPECIAL NOTICE.

In all cases where it is possible, the Prescriptions and Medicines dispensed at my Pharmacy are compounded from the products of the laboratory of Dr. E. R. SQUIBB, of Brooklyn, thus insuring to both physician and patient Medicines whose purity of quality, and reliability of character, are above suspicion.

Being very desirious of receiving the full confidence of Physicians of this city, I shall ever strive to deserve the same by keeping in my Pharmacy only **Medicines of the Finest Quality and Strictest Purity.** The careful dispensing of Physicians' Prescriptions is the **Leading Feature** of my business.

Physicians in all cases can rely on obtaining, in their Prescriptions, **just what Medicines they Prescribe, and none other,** as no substitution is allowed without first consulting the Physician.

PHYSICIANS CAN ALWAYS FIND AT MY PHARMACY

THE GREAT EUROPEAN NOVELTY.

HUNYADI JANOS.

NEW APERIENT WATER.

Specially recommended for richness in aperient salts, and its efficacy in Bilious attacks, prevention of Gout, Piles, etc., and as an ordinary aperient, by LIEBIG, VIRCHOWS, CANZONI, and SIR HENRY THOMPSON, and the entire medical profession in England and Germany.

DR. J. MARION SIMS, New York: "As a laxative, I prefer it to every other mineral water."

DR. JAMES R. WOOD, New York: "Certain, but gentle and painless; superior to any other bitter water."

DR. WM. A. HAMMOND, New York: "The most pleasant and efficient of all purgative waters."

DR. ALFRED L. LOOMIS, New York: "The most prompt and most efficient; specially adapted for daily use."

DR. FORDYCE BARKER, New York: "Requires less, is less disagreeable and unpleasant than any other."

DR. LEWIS A. SAYRE, New York: "Preferred to any other laxative."

FOR SALE BY DEALERS, GROCERS AND DRUGGISTS.

Pullna Bitterwater.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

PRICE.—Case of 20 Pint Jugs.....$3.25 by
" Case of 50 Pint Jugs..... 6.00 "
Less discount according to quantity.

FOR SALE BY ALL DRUGGISTS.

APOLLINARIS

NATURAL

Mineral Water,

THE QUEEN OF TABLE WATERS,

HIGHLY EFFERVESCENT.

DR. LEWIS A. SAYRE. "A delightful beverage—Great relief for sea-sickness."

DR. WILLIAM A. HAMMOND. "Far superior to Vichy, Seltzer, or any other."

DR. ALFRED L. LOOMIS. "Most grateful and refreshing.

DR. R. OGDEN DOREMUS. "Absolutely pure and wholesome; superior to all for daily use; free from all the objections urged against Croton and artificially-aerated waters."

PROF. WANKLYN, London, Eng. "Impregnated only with its own gas."

DR. E. R. PEASLEE. "Useful and very agreeable."

DR. AUSTIN FLINT. "Healthful, and well suited for Dyspepsia, and cases of acute disease."

DR. JAMES R. WOOD. "Mildly antacid; agrees well with dyspeptics, and where there is a gouty diathesis."

DR. FORDYCE BARKER. "By far the most agreeable, alone or mixed with wine, useful in Catarrhs of Stomach or Bladder and in Gout."

DR. J. MARION SIMS. "Not only a luxury, but a necessity."

To be had of all Wine Merchants, Grocers, Druggists and Mineral Water Dealers throughout the United States, and wholesale of

FRED'K DE BARY & CO.,

41 & 43 WARREN STREET, NEW YORK.

WARBURG'S TINCTURE.

Made from the original recipe of Dr. Warburg and used as a specific in malarious fevers and all diseases arising from malaria. This preparation is recommended by the English Government, and extensively used in all the English military hospitals, particularly in the East Indies. (see London *Lancet*, Nov. 13, 1875.)

Please specify, in ordering from any wholesale house, **Warburg's Tincture**, made by **F. A. REICHARDT.**

Price per bottle, 1 oz., **75c.**; per doz., **$5.00.** Per pint, **$5.00**; per doz., **$50.00.**

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynecologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. **$1.00** per dozen, sent by mail. Orders executed by return of mail.

F. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ½ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. **90c.** per dozen; **$10.00** per gross.

F. A. REICHARDT. Pharmacist,

404 Fourth Avenue, corner 28th Street, New York.

SEABURY & JOHNSON,

Originators and Manufacturers of

U. S. PHARMACOPŒIA MEDICINAL AND SURGICAL

Plasters POROUS AND SPREAD in Rubber Combination

NEW YORK AND LONDON.

Received highest and only Award (Medal and Special Diploma of Merit) over all Foreign and Home Competitors in 1876.

THE JURORS' AWARD IS SUBSTANTIALLY.

ORIGINALITY.—The successful application of Rubber as a base for all medicinal and mechanical plasters.

RELIABILITY and general excellence of manufactures.

FACTS CONCERNING MEDICINAL PLASTERS IN RUBBER COMBINATION.

Indiarubber-spread and Porous Plasters possess indisputable advantages over all other Plasters: (1) The Rubber Combination preserves the incorporated drug or extract from decomposition or volatilisation; (2) They adhere closer and firmer; (3) They do not soil the skin or linen; (4) They are always pliable, and never become hard or brittle; (5) They adhere without heat or moisture; (6) An increased effect is obtained by being porous, as the Plaster neither slides nor moves from its affixed position.

BELLADONNA PLASTER, U. S. P.

IN RUBBER COMBINATION.

Messrs. SEABURY & JOHNSON claim that theirs is the most thoroughly reliable and only strictly officinal Belladonna Plaster ever offered the medical profession. It is an improvement on other Belladonna Plasters in several important particulars. First, it is incorporated with the officinal alcoholic extract only. Secondly, it is freed from all stimulating qualities, thereby insuring the uninfluenced sedative action of Belladonna. Thirdly, it adheres with greater tenacity than others. Physicians have been prejudiced in favor of Allen's English Extract; but recent analysis, fairly conducted by competent chemists, emphatically condemns the Inspissated Extract as a mild and unstable product, representing but one-half or less than one-half of the strength of the U. S. P. Alcoholic Extract of Belladonna. The following result, published in the *American Journal of Pharmacy*, in April, 1876, page 145 is furnished for your consideration, which indicates the following percentage of Atropia in the respective extracts:

Alcoholic Extract Belladonna, U. S. P......2,571
Allen's English Extract.....1,411
Herring's English Extract.....1,179

The practitioner, as well as ourselves, has but one choice.

Considering these features from a professional standpoint, we offer a Belladona Plaster which cannot be improved upon.

SALICYLATED SURGEONS' RUBBER ADHESIVE PLASTER.

This article has met with unprecedented success, and has been emphatically pronounced by our most skilful General and Orthopædic Surgeons, as "the best Surgeons' Adhesive Plaster known". It is applied without heat or moisture, conforms quickly to the parts; is perfectly flexible and waterproof, and is ready for use at any moment. It is free from irritating properties and very healing. In counter-extension it has no equal, as it does not move or slide after being applied. Our India Rubber Adhesive Plaster is also spread on twilled linen, which resists the most powerful strain. In addition to these general improvements, the plaster being impervious to water, wounds can be cleansed without removing the plaster, obviating the necessity of constant redressing, saving labor and time. **Whenever continued powerful adhesion is required, it should be procured in porous form.**

MUSTARD PLASTER (spread on Cotton Cloth).

Our Mustard Plaster is a decided improvement over the best French makes; the mustard is manipulated so as to exclude all the moisture, retaining unimpaired by such treatment its essential properties. They are always reliable, conform quickly to the part, and when thoroughly wet do not break into pieces, as is the case with all other mustard plasters. They do not crack or peel off, and can be removed without soiling the skin or linen. Being **manufactured only of pure mustard,** they are perfectly free from Croton Oil or other dangerous substitutes, often employed to induce intense irritation.

RUBBER BLISTER PLASTER (Camphorated) B. P. STRENGTH.

This article has a splendid reputation; its characteristic action is not impaired by age in any climate. The whole fly is incorporated, which by constant manipulation is thoroughly and beautifully combined with the plaster. **Its properties are developed quicker, and its blisters in less time than the cerate.** It never fails to blister when used as directed. In addition to its superior efficacy as a vesicant, we incorporate a sufficient quantity of Camphor, which, with the Olive Oil, used on the face of the plaster, **prevents Strangury.** This improvement will be appreciated by every practitioner. It is more reliable than any known cantharidal preparation.

CAPSICUM PLASTER.

Recently this article has crept into favor with our most esteemed physicians, and judging from results it is doubtless the best rubefacient known. It has the specific action of mustard without its objections. The characteristic action of Capsicum is uniformly maintained from twenty-four to forty-eight hours, without blistering, being mild, continuous, and stimulating. This plaster is spread in rubber combination and in porous form. Experience has taught practitioners that the Oleo Resin of Capsicum is too violent, frequently vesicating; we incorporate the crude drug in sufficient quantity, without risk to the patient. Our Capsicum Plasters will be found more practical for general use than the **so-called Mustard or Capsicum Papers.**

SAMPLES SENT TO PHYSICIANS ON APPLICATION.

SPECIAL NOTICE TO PHYSICIANS.

Quality is of great importance to the practitioner: by reliable preparations he supplements his own skill. You can therefore rest assured that every article we manufacture is of strict pharmacopœia strength, and incorporated with perfectly reliable Extracts and Drugs, well selected, carefully and conscientiously prepared, and manufactured invariably under the personal superintendence of one of our firm. **Our whole attention and study is devoted entirely to the art of Plaster making,** and we are ready at all times to receive suggestions from the fraternity, which may be of benefit to all.

SEABURY & JOHNSON,

21 Platt Street, New York.

ALL OF THE ABOVE ARTICLES SOLD BY DRUGGISTS EVERYWHERE.

OF THE
UNIVERSITY OF BUFFALO,
BUFFALO, N. Y.
Session of 1877-78.

Preliminary Term begins.....Oct. 3.
Regular Term " .....Nov. 7.

FEES.—Matriculation, $5.00. Faculty, $100.00. Perpetual Ticket, $150.00. Graduation Ticket, $25.00.

THOMAS F. ROCHESTER, M.D., Dean,
Buffalo, N. Y.

MIAMI MEDICAL COLLEGE
OF CINCINNATI.

Next Session will commence October 3d, 1877. Professors' Tickets, $40.00.

FACULTY.—JOHN A. MURPHY, M.D., Dean; E. WILLIAMS, M.D.; WM. CLENDENIN, M.D.; WM. H. TAYLOR, M.D.; J. B. HOUGH, M.D.; W. H. MUSSEY, M.D.; T. H. KEARNEY, M.D.; J. C. MACKENZIE, M.D.; W. B. DAVIS, M.D.; BYRON STANTON, M.D.

For Circulars, address JOHN A. MURPHY, M.D.,
No. 168 West 7th Street.

STARLING MEDICAL COLLEGE,
COLUMBUS, OHIO.

The Thirty-first Session of Starling Medical College will commence October 4, 1877, and continue until March, 1878. It will be preceded by a preliminary course beginning September 1, 1877. Extensive additions have recently been made to the Museum and other teaching facilities of the College.

Francis Carter, M.D., Emeritus Professor of Obstetrics and Diseases of Women and Children, and Dean of the Faculty.
H. G. Landis, A.M., M.D., Professor of Obstetrics.
Sam'l D. Turney, M.D., Professor of Diseases of Women and Children.
Theo. G. Wormley, M.D., LL.D., Ph.D., Professor of Chemistry.
James H. Pooley, M.D., Professor of Surgery.
Starling Loving, M.D., Professor of Practice of Medicine.
John M. Wheaton, M.D., Professor of Anatomy.
R. E. Fullerton, M.D., Professor of Materia Medica and Therapeutics.
W. J. Conklin, M.D. (of Dayton), Professor of Physiology.
W. J. Wolfley, M.D., Professor of Opthalmology and Otology.
Alex. Dunlap, M.D., Professor of Surgical Diseases of Women.
Hon. J. W. Baldwin, M.A., Professor of Medical Jurisprudence.
D. A. Morse, M.D., Professor of Nervous Diseases and Insanity.
Otto Frankenberg, M.D., Professor of Pathology.
T. C. Hoover, Prosector to the Chair of Surgery, Lecturer on Minor Surgery and Demonstrator of Anatomy.

College, corner of State and Sixth Sts.; Dean's Office, 181 East State St.; Secretary's Office, 72 East Gay St.

Letters of inquiry should be addressed to the Dean.

PROF. FRANCIS CARTER, M.D., Dean, Columbus, Ohio.

UNIVERSITY OF MICHIGAN.
DEPARTMENT OF MEDICINE AND SURGERY.

The 29th annual course of lectures will commence on Oct. 1, 1878, and continue *nine months*.

Course separate but equal for women.

Matriculation Fee, *paid but once*—Residents of Michigan, $10; non-residents, $25.

Annual Dues—Residents of Michigan, $20; non-residents, $25.

Graduation Fee—For all alike, $10.

Send for Circular and Catalogue.

IOWA STATE UNIVERSITY,
IOWA CITY, IOWA.

MEDICAL DEPARTMENT.—SESSION OF 1877-'78.

The next regular course will commence on Wednesday, October 24th, 1877, and continue until the first Wednesday in March, 1878. The preliminary term will begin on Wednesday, October 10th, and continue until the opening of the regular course. Clinical instruction in Mercy Hospital gratuitous. Advanced students will be intrusted with the care of cases. Applicants for graduation will be required to perform operations upon the cadaver. An abundant supply of dissecting material constantly on hand.

FEES.—For the entire Course, $80.00. Matriculation Ticket, $5.00. Demonstrator's Ticket, $5.00. Graduation Fee, $25.00. For further information, address W. F. PECK M.D., Dean Davenport, Iowa,
Or, ELMER F. CLAPP, M.D., Sec'y, Iowa City, Iowa.

N. H. MEDICAL INSTITUTION AT
DARTMOUTH COLLEGE.

The *Eighty-second* Annual Course of Lectures begins Aug. 1, 1878, and continues fourteen weeks. Recitations from Dec. 5 to June 20.

FACULTY:—E. E. Phelps, M.D., LL.D., Practice Emeritus; A. Smith, M.D., LL.D., Therapeutics Emeritus; O. P. Hubbard, M.D., LL.D., Chemistry; E. R. Peaslee, M.D., LL.D., Gynecology; J. Ordronaux, M.D., LL.D., Medical Jurisprudence; C. P. Frost, M.D., Practice; P. S. Conner, M.D., Surgery; E. S. Dunster, M.D., Obstetrics; H. M. Field, M.D., Therapeutics; L. B. How, M.D., Anatomy and Physiology.

FEES:—Matriculation, $5; Lectures, $77; Graduation, $25; Recitations, $40.

For Circular, address C. P. FROST, M.D., Dean, Hanover, N. H.

MEDICAL DEPARTMENT OF
HARVARD UNIVERSITY,
BOSTON, MASS.

NINETY-FOURTH ANNUAL ANNOUNCEMENT. (1877-'78.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 27th, 1877, and ends the last Wednesday in June, 1878. Persons who hold no degree in arts or science must hereafter pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 24th.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing

DR. R. H. FITZ, Secretary, 106 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF
YALE COLLEGE.

Spring Term begins February 14, and closes June 26, 1878.

Winter Term begins October 3, 1878; closes January 20 1879

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $60.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing

H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar,

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1877, and continue twenty-one weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

WM. H. BYFORD, A.M., M.D., President.
T. D. FITCH, M.D., 296 West Monroe St., Secretary.
CHAS. W. EARLE, M.D., 87 Park Ave., Treasurer.

Official Announcements of the Medical Colleges of the U. S.

The Fourteenth Annual Course of Lectures in the

Medical Department of the University of Wooster,

LOCATED AT CLEVELAND, OHIO,

Will begin Wednesday, October 3d, 1877, and continue until the last Wednesday in February, 1878. Medical and Surgical Clinics, Monday and Tuesday, Thursday and Friday of each Week, at Charity Hospital. The Preliminary Term commences Sept. 19. The Summer Course of Recitations and Clinics begins April 2, 1877, and continues 12 weeks.

FACULTY:—G. C. E. WEBBER, M.D., Dean; L. FIRESTONE, M.D., LL.D.; W. J. SCOTT, M.D.; H. J. HERRICK, M.D.; CONWAY NOBLE, Esq.; A. C. MILLER, M.D.; JOEL POMERENE, M.D.; D. B. SMITH, M.D.; H. W. KITCHEN, M.D.; T. CLARK MILLER, M.D.; JOHN H. LOWMAN, M.D.; G. T. GENTSCH, P.C. For Circular and Catalogue, address H. W. KITCHEN, Sec'y,
No. 3 Euclid Avenue, Cleveland, O.

CLEVELAND MEDICAL COLLEGE,

Cor. St. Clair and Erie Sts. Founded 1843.

FACULTY:—JARED P. KIRTLAND, M.D., LL.D.; J. L. CASSELS, M.D., LL.D.; PROCTOR THAYER, M.D.; JOHN BENNETT, M.D., Dean; JACOB LAISY, M.D.; JOHN E. DARBY, M.D.; H. W. MORLEY, M.A.; FRANK WELLS, M.D.; ISAAC N. HINDS, M.D.; X. O. SCOTT, M.D.; R. W. HOLLIDAY, M.D.; N. P. SACKRIDER, M.D.; LEWIS BUFFETT, M.D.; H. H. POWELL, M.D.; WILLIAM WALLACE HOLLIDAY, M.D.

FEES.—Lecture Tickets, including Matriculation and Demonstrator's Ticket, $50. WINTER SESSION.—Commences on the third Wednesday in September, and continues 24 weeks.
SUMMER SESSION.—Commences on the first Monday in April.

Medical School of Maine,

AT BOWDOIN COLLEGE.

Fifty-Eighth Annual Course of Lectures for 1878 will commence February 14, and continue sixteen weeks.

FEES.—Matriculation (payable each term), $5.00. Full Course (in advance), $75.00.

ALFRED MITCHELL, M.D., Secretary,
BRUNSWICK, ME.

Woman's Medical College of Pennsylvania.

THE TWENTY-EIGHTH WINTER SESSION

Will open on Thursday, October 4, 1877, in the commodious new College Building. Clinical instruction is given in the WOMAN'S HOSPITAL, Pennsylvania, *Wills, Philadelphia* and *Orthopædic Hospitals*. *Spring Course* of Lectures, Practical Demonstrations, and *Winter Quizzes* are free (except for expense of material) to all Matriculants of the year.

Address
RACHEL L. BODLEY, A.M., *Dean*,
North College Ave. and 21st Street, Philadelphia, Pa.

WANTED.

BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

Prepared by CLIN & CO., Pharmacists, Paris.

LA PLATA EXTRACT OF MEAT.

CH. DELACRE,
Sole Consignee,
IXELLES, BELGIUM.

Agents for the U. S.,
E. FOUGERA & CO.,
NEW YORK.

This Extract is a pure extract of Beef, prepared according to the improved process of Baron von Liebig, unsurpassed in quality, free from fat and gelatine, each pound of which contains the soluble nutritive constituents of 34 to 36 pounds of the finest beef, exclusive of bones and fat, corresponding to about 45 pounds of good butcher's meat. As a medicinal agent it will be found of great value to the sick, invalid, and persons and children of weak constitutions. ***It will keep unaltered for years in any climate.***

CAUTION.—Physicians wishing to use a pure extract of beef will do well to specify the ***"La Plata,"*** since it is never offered for sale until it has been analysed by Mr.

CH. DELACRE, Chemist, General Consignee at Brussels,

and found by him to possess the essential qualities of the best articles of this kind.

None genuine without the above trade-mark—*Bullock reclining.*

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of Iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

TO PHYSICIANS.

THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, i. e., the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving resules of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

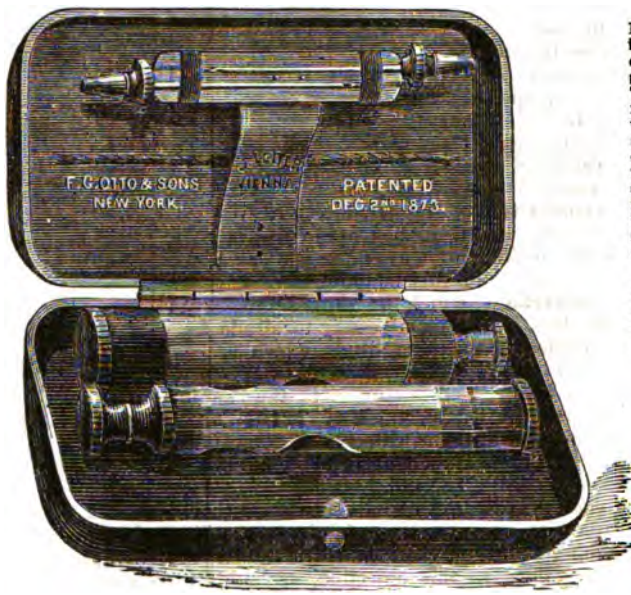
LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.



The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the ***Medical Department of the United States Army.***

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion, may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatizing Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Peptodyn, the New Digestive, is a combination of the whole of the digestive secretions—Pepsine, Pancreatine, Diastase, &c., forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition.

N.B.—*The success of this Remedy has led to several imitations of it*, which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMITH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

Messrs. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

THE MANUFACTURERS,

KEASBEY & MATTISON,

332 N. Front Street, Philadelphia.

WARNER & CO.'S
SUGAR-COATED QUININE PILLS.

(With Twenty-Six Combinations.—See List.)

QUININE PILLS of our make are prepared from *Sulphate of Quinia* of American manufacture, noted for its purity and excellence. Each Pill contains the full complement of material as expressed on the label, without the necessity of adding any excess to compensate for impurities. They are perfectly soluble, and physicians can depend upon getting the full benefit of this valuable remedy in a pleasant form.

SUGAR-COATING, properly applied, does not impair the quality of such medicines as are commonly thus enclosed. *Dr. W. S. Edgar, Editor, says:*—"We procured a variety of W. R. WARNER & Co.'s preparations, and have prescribed them as opportunity offered, with *satisfactory evidence of their purity*, and reliability as to the quantity in each dose; also, we extract the following paragraph from a letter by a competent analytical chemist:"—

SUGAR-COATED QUININE PILLS.

"I take pleasure in testifying that W. R. WARNER & Co.'s QUININE PILLS are practically just what they claim to be, whether judged by analytical tests or by the therapeutic effect obtained from their use.

DETROIT, MICH. "A. B. LYONS, M.D., *Analytical Chemist.*"

WILLIAM R. WARNER & CO., Manufacturers of Sugar-Coated Pills,
1228 Market Street, Philadelphia.

SCOTT'S EMULSION
PURE COD LIVER OIL
WITH
HYPOPHOSPHITES OF LIME AND SODA
PERFECT, PERMANENT, PALATABLE.

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

REPORT OF SIX ADDITIONAL CASES OF STRICTURE OF THE RECTUM.

TWO TREATED BY RECTOTOMY.

By PHILIP S. WALES, M.D.,

MEDICAL INSPECTOR, U. S. NAVY.

In No. 8 of The Medical Record for 1877, I published an account of two cases of rectal stricture successfully treated by a new mechanism for dilatation. Since that time I have been endeavoring to improve it, and after much delay and difficulty I was fortunate enough to interest Messrs. Tiemann & Co., of New York, in the matter, who, with their well-known skill and ample manufacturing resources, by dint of numerous, patient, and expensive experiments, have succeeded in carrying out my plans admirably.

The dilators now present a beautifully polished surface, which, by reducing friction, increases the facility of introduction and eliminates the unpleasant sensation of dragging caused by a rough instrument.

Although devised at first for the treatment of stricture, I soon recognized the advantages of the instrument in intestinal catheterism for other forms of abdominal disease, and have already used it hundreds of times, attaining a height of thirty-two inches in the colon.

If the statements of Dr. Edward Krull, of Güstrow,* are confirmed by future experience, the instrument will find a practical application in irrigation of the bowels. He uses water in this way for catarrhal jaundice, and declares that success has crowned the treatment when other means have failed. In one case the patient had suffered nearly a year and a half. He first employed water at the temperature of 59° Fah., and gradually increased the heat with successive injections to about 73° Fah. The water was thrown in slowly in as large a quantity as could be held, and the longer it is retained the better. The operation was repeated daily, and in the majority of his cases the biliary secretion was re-established, with great relief to the patient, after the second injection, rarely more than seven being required in any case. He believes the improvement to be due to the reflex influence of increased peristalsis of the bowels upon the liver and gall-bladder. Again, Professor Mosler has been advocating a plan of treating tape-worm, which has been attended with remarkable success.† Its chief characteristic is the injection of large quantities of warm water into the colon, after the administration of the anthelmintic. The diet is first regulated, food being given which is supposed to be distasteful to the tape-worm—bilberry tea, herrings, sour cucumbers, salt meats. The intestine having been emptied, as far as possible, by laxatives, a dose of the extract of pomegranate bark, prepared from the fresh bark, is administered, and then a large quantity of warm water is injected into the rectum. The theory is that the worm, previously brought down into the colon, is prevented by the water from attaching itself to the wall, and is brought away by the liquid in its escape. It is asserted that in every case in which this treatment was adopted the head of the worm was removed. I employed with success the plan of injecting a solution of carbolic acid and salt high in the colon after a preliminary administration of oil of turpentine, in the case of a gentleman who had been troubled for months with tape-worm. Several of the most esteemed vermicides, as kameela, brayera, male fern, and pomegranate, had failed in bringing the head, although proglottides were expelled after each administration of these remedies.

Many other instances of the utility of intestinal catheterism and irrigation might be cited, as in intussusception, impaction of fæces, intestinal inflammation and ulceration, atony of the bowels, uterine diseases, etc. The wider the field of application, and the greater the frequency of use of any new mechanism, the greater is the necessity of reducing its possible harmfulness in hands little skilled in surgical manipulations. In my opinion this advantage has been secured in this instrument as far as it is possible, and I cannot conceive that any damage can be done except by the most blamable violence, even when the walls of the intestine are preternaturally soft. That the ordinary contrivances are not free from danger, such as Bell's explorer, O'Beirne's tube, and the various forms of bougies and sounds made of metal, wax, and other materials, is shown by the records of surgical science. The intestinal walls have been repeatedly perforated by them, both in cases where there was no obstruction and in those in which there was.

Sir B. C. Brodie* asserts that he knew seven or eight cases in which this frightful accident occurred, and the patients died in consequence. I will here append, in further illustration of the danger of O'Beirne's tube, the following case, related to me by a professional friend:

Case III.—Mrs. H., aged 65, a large, fleshy woman, called me to see her late in November, 1875. She stated that she had passed nothing from her bowels for four or five days, previously to which time she had had several loose and very copious evacuations. No pain; pulse quiet and regular. The abdomen was very largely distended and tympanitic, and the colon could be easily felt in its entire course till it dropped into the pelvis. Only slight tenderness on pressure. The symptoms continued for five or six days without other changes than a gradual weakness of the vital powers. No treatment, either by medicine or the frequent use of injections, relieved the obstruction, which, from the absence of any gastric disturbance whatever, as well as of general constitutional disturbance, was diagnosed to be situated low down in the large intestine. Dr. S., in the meantime, saw the case with me, and we determined to introduce O'Beirne's tube as far up the bowel as possible, using injections through this, with the hope of relieving our patient. We passed the tube a considerable distance up the bowel, but were deterred from using the injection, from the fact that no gas escaped from the tube, and on withdrawing it it was not stained with any fecal matter.

Mrs. H. gradually sank, and died at 5 o'clock P.M., the next day, by asthenia. A post-mortem, made a few hours after death, showed the rectum bound down over the promontory of the sacrum by a band of false membrane, stretching transversely across the bowel, rendering it impervious from above and below. Just below the constricting band was a rent in the intestine, evidently made by the O'Beirne tube, and accounting quite satisfactorily for the distance to which it had penetrated the day before. Except this band of false membrane there was no effusion of lymph or serum, and the peritoneum was free from any evidence of in-

flammation. I would mention that the instrument used was of large size—larger than those that I saw at your office—with an ivory head-piece, and that every caution and gentleness was practised in using it.

Of the next three cases which I am about to relate, the first two originated from inflammation of the intestinal mucous membrane, due, in great part, to repeated attacks of malarial fever; the third, I regard as an instance of congenital stricture of the rectum, few cases of which are recorded. M. Thume reports one in the *Nouvelle Bibliotheque Médicale*, Mai, 1828; and M. Tuffet another of unusual interest in the *Bulletin des Sciences Médicales*, tome VII., p. 160.

Case IV.—I. D., a physician, aged 42, called upon me, March 6, 1877, complaining of what he believed to be some rectal trouble, and which a professor of surgery had diagnosticated stricture of the rectum, and had suggested the operation of dividing the sphincter, introducing the whole hand into the gut, and stretching the contracted bowel with the fingers. The patient courteously furnished me with the following account of himself, from which I make the following extracts: "I told you, in speaking of my case, that I have had chronic diarrhœa for twenty years, or more. Apart from the inconvenience involved, as it is no respecter of time, place, or circumstance, I have regarded this diarrhœa as rather conservative than otherwise; for, except occasional malarial trouble, my health, up to the last year, has been all that I could desire. In this time, more or less pain in the hypogastric region, extending into the left iliac, preceding and during the act of defecation, remaining much longer at stool than usual, and often a gush of liquid fæces; the passage of short, flattened pieces, sometimes as many as a dozen, are symptoms which have been increasing month by month. I found, too, that horseback-riding, often the country doctor's only means of getting around to his patients, became extremely painful, and finally had to be given up entirely. During the months of August, September, and October last, a protracted and painfully distressing case of illness in my own family caused me to lose rest at night continuously, and this, added to the fatigue incident to almost daily attention to professional business around the country, greatly reduced my strength, and increased the sufferings complained of. I have mentioned pain as an almost constant symptom. At times it is most severe, frequently causing nervous chill, and always puts me on my back for several hours. Another distressing symptom for the last five or six months is insomnia; I hardly know what it is to get an uninterrupted night's sleep."

I examined this case with my explorer, and found a stricture seven inches from the anus. The dilatation was begun, and improvement was soon manifest, and has continued up to the present time, as will be seen by reference to the following extract from a letter dated November 16th: "I promised you a statement of my case since you commenced treating me last March for stricture of the rectum, with your dilators. It gives me great pleasure to assure you of my conviction that the contraction of the bowel has been relieved. I no longer suffer from that peculiarly distressing pain before and during the act of defecation I have so often described to you. The feeling of weight and oppression in the lower bowels, which rendered any other position than a reclining one disagreeable, and often impossible, has left me, and I can take a fair amount of exercise now, without the irresistible inclination to go to the water-closet."

Case V.—C. E., aged 28, a baker, was sent to me, June 8, 1877, by Dr. D. H. Hagner, of Washington, to be treated for rectal disease. The patient related his case clearly, stating that about four or five years ago he had had intermittent fever off and on for several months, and then he became conscious of pain and aching in the sacrum and perineum; his bowels were irregular, there was difficulty in defecation, and the fæces were diminished in size. The bladder was irritable, requiring him to micturate frequently during the day and night, and every time he did so there was an irresistible desire to evacuate his bowels also, and *vice versa*. The bladder was carefully examined, and no stricture or stone found; the largest sound slipped in easily, causing not the slightest uneasiness. The rectum was explored first with the finger, the patient being erect, and directed to strain forcibly, while the perineum was pushed up with all the force I could exert, aided by an assistant who seized my elbow. Under the circumstances the bowel was somewhat intussuscepted, and the tip of the finger could reach a ring-like narrowing, which seemed to be situated at least four and a half inches from the sphincter. The explorer was then introduced, and expanded to the diameter of an inch and a half, or thereabouts. It caught above when drawn upon, at the point stated, and showed the stricture to be a narrow one.

The dilators were used three times a week, with manifest benefit; the troubles about the bladder entirely disappeared, and defecation was effected with greater ease. Business called the patient to a distant city, and I have not seen him since.

Case VI.—Mrs. R., age 28; mother of two children, first came under my notice while laboring under a severe attack of colic, as she imagined, from eating water-melon. She told me that her bowels were always constipated, never acting without taking purgative medicine, and that this state of affairs had begun many years ago. Her abdomen is very large, and her body generally unnaturally adipose. Appetite always good, but was very guarded in matters of diet on account of her bowels. This was about all she knew of herself.

In the attack of colic, I prescribed purgatives, without obtaining any action, and unless I kept her continuously under hypodermic injections, she complained grievously of pain along the course of the colon. I determined to use my long, elastic dilator, and inject warm water. Upon introducing the point of the instrument into the anus, I found it would not pass beyond an inch. My finger soon revealed a narrow cord-like constriction about one inch from the margin of the anus, through which I could press my finger with difficulty, and great pain to the patient. The bowel above seemed to be quite natural and capacious. I suggested the use of the knife, but this was declined; though dilatation was approved of. To relieve her immediately, I passed one of the smaller sizes of the dilators seventeen inches into the rectum, and injected large quantities of warm water until the bowels were freely moved, with immediate relief to all the symptoms.

The following two cases were instances in which the stricture was within reach of the finger, and were treated by incision followed by dilatation in the usual manner:

Case VII.—C. T. V., a physician, aged 41, consulted me October 20, 1876. He was kind enough to keep the record of his own case, and furnished me with the following account a year after the operation:

"I am of a nervo-bilious temperament, dark complexion, measure five feet ten and three-quarter inches in height, and weigh one hundred and twenty pounds. My habits are good. I suffered with acute hepatitis in

1857. The liver and gastro-enteric canal were for months after this very irregular in their functions; my digestion was feeble and sluggish, and I was a victim to severe colics, particularly during the spring and fall. This condition of things demanded the most rigid dietary. During this time I noticed a great development in the veins of the lower extremities and surface of the abdomen; hemorrhoidal tumors formed around the anus, which frequently bled. Mental depression was now a prominent feature in the case. I became emaciated, my pulse beat 65 in the erect posture, and I experienced a sensation of weight in the rectum, pain in the back, cold extremities, borborygmi, eructations, heaviness in the occipital region, aphthous eruption of the buccal mucous membrane, pain in the cardiac region, and at times palpitation. There was a constant mucous discharge from the rectum.

"In the month of May, 1876, I had a very severe attack of hemorrhoids, and in a few weeks afterwards a tumor was formed within the rectum, just above the sphincter. The pain was excruciating, and lasted a whole night; but by the constant application of hot water the pain finally ceased, and a purulent discharge made its appearance through the anus, the tumor disappearing. About a month later, a painful swelling was felt on the right side of the anus, which also broke and formed a fistula as the former had done. The aperture of the one was posterior, of the other lateral. There was a profuse discharge of pus, so that my health was completely shattered. At this point I visited Washington, and consulted you."

I made a physical examination of the patient and found a stricture three inches from the anal orifice, horizontal, entirely surrounding the bowel, with a rounded and cord-like margin about one-quarter of an inch thick. The aperture admitted the point of the index-finger to the distal end of the second phalanx, and was situated more to the sacral side of the obstruction. I traced the lateral fistulous canal, whose orifice was well out upon the nates, above the stricture, so that when the point of the director was at the constriction, the handle was in contact with the skin. The second fistulous canal terminated in the first. The tissues of the perineum were hard and brawny, and the skin very red. There was always more or less discharge of blood and pus with the fæces, and tenesmus was also present.

I performed rectotomy, cutting the stricture first laterally, at the same time laying open the fistulous canal, and then I incised the ring posteriorly so that the bowel was completely freed of all obstruction. A few ounces of blood were lost. I inserted a fine sponge to prevent further bleeding and put the patient to bed, giving him a good dose of opium. Several hours later, hemorrhage came from the cut below the sponge, but it was promptly stopped by stuffing in some styptic cotton. Three days later the dressings were removed and the bowels syringed with a dilute solution of carbolic acid. In December the patient left for his home in New Jersey, and was under the care of a professional friend, who continued the use of appropriate dressings. The patient continued to improve, and soon resumed his practice. In a letter written to me recently he says: "It is now one year since the operation was performed, and only a small aperture remains, which is healing slowly but surely, and my health is re-established."

Case VIII.—A. C., aged 37, came under my care September 23, 1877. The history of the case runs thus: In youth was healthy, but not vigorous. His father, who is yet alive, possesses an active, hardy constitution, but has complained of gastro-intestinal troubles for years; the same remarks are applicable to a younger brother. Members of his family have been noted for longevity.

In 1861, had stricture of the urethra arising from a neglected gleet, and from time to time, until 1863, had dull pain about the anus. Contracted syphilis in 1865, chancre and bubo; never had any condylomata or other local changes around the fundament during this time. Alteration in the shape of the fæces, which were flattened or shaped more like the blade of a razor, gastric irritability, rumbling of the stomach, especially during the night, and early morning; a morbid craving for food and a feeling of exhaustion were prominent features of his case during 1869–70.

In 1871, a node developed upon his left shin, suffered from nocturnal pains, and was a frequent victim of diarrhœa. For these troubles he underwent mercurial treatment. In the following year he could not retain fæcal matter; the moment the desire came on he was compelled to rush for the closet. His health became now much deteriorated; was attacked by a sharp rectal hemorrhage in 1874, which was checked by astringents; felt more or less pain constantly over the sacrum during this year. Passed pus and mucus like the white of an egg, and the slightest imprudence in diet, or exposure to atmospheric vicissitudes, brought on diarrhœa. This state of things has continued up to the present time, and in addition is greatly distressed by tenesmus. Last May, after eating a snipe, a small bone caught in the rectum, producing severe diarrhœa, and purulent discharge mixed with blood. He told me he had been lately under treatment for rectal ulceration by caustic.

I examined the rectum after having largely dilated it with a duck-bill speculum. A stricture was clearly visible two and a half inches from the anus, placed obliquely across the bowel, so that upon its vesical side the distance was about three inches. The aperture was closed, but admitted the point of the index-finger, though with pain to the patient. The bowel above was of ample capacity as far as could be reached. The obstruction was about one-quarter of an inch thick, and tightly stretched, its aperture ovoid, eccentric, with the broad end towards the bladder. Its edges were rounded, intensely red, and granular. On passing the finger around the aperture, the posterior and narrow border felt hard and callous, seemingly tied down to the subjacent stratum, while the anterior border was broad, tense, and dilatable. It struck me that at the former spot there had been an ancient ulcer.

Situated at the front part of the anus was a large muco-cutaneous pile; posteriorly near the sphincter were two large condylomata, and on the same aspect internally, a fissure. The entire skin of the perineum and nates adjacent was of a deep red color. His general condition is bad, being thin, weak, sallow, and mentally depressed. His abdomen is much distended, but not tender; is tormented by alternating constipation and diarrhœa, with constant tenesmus; purulent matter and mucus are constantly escaping from the bowel, and keep the regions around anus always moist.

The operation of rectotomy was performed with a specially constructed knife. The stricture was divided freely through its anterior border, the tissues cutting with a creaking noise, distinctly audible to the assistants standing near. The incision gaped widely, forming an ellipse, and at the same time the stricture seemed to instantly vanish instead of leaving flaps as had been expected, the intention having been formed to clip them off. The growths around the anus were all removed

by excision, and the sphincter was cut through posteriorly in the line of the fissure and the posterior angle of the stricture. Very little bleeding occurred; the rectum was dressed with a sponge thrust beyond the line of the incision, and opium was freely given. Ten hours after the operation hemorrhage occurred, by the sponge having been forced out of the bowel. It was speedily checked by replacing the sponge and packing the bowel below with styptic cotton. The dressings remained in place for forty-eight hours, when an irresistible desire to evacuate the bowels came on, which induced the patient to remove the sponge himself by pulling on the thread attached to it. On the third day there was an enormous quantity of fecal matter passed, which greatly alarmed the patient, who feared, he said, that the entire contents of the abdomen were issuing. He continued to improve; and on the tenth day I introduced one of my largest elastic dilators fifteen inches into the bowel, permitting it to remain twenty minutes, and before withdrawing it, threw in a pint of water dashed with carbolic acid. The finger detected a hard lump at the side of the anterior incision, evidently caused by lymph infiltrating the submucous connective tissue.

The patient is gaining in strength, and time will be necessary for the cure of the changes consecutive to the stricture.

One of the most interesting questions presented by rectal strictures is that of the manner in which they are formed. The explanations offered are too varied to be introduced separately, but the accounts found in special treatises on the rectum, and in the more recent ponderous compilations on general surgery, may be condensed in these statements. It is attributed in the majority of cases to inflammation arising from various causes. Congestion takes place in all the tunics of the bowel, plastic matter is effused into the meshes of the tissues, concretes, organizes, and contracts, diminishing the calibre of the intestine. If the morbid action is restricted to one side of the bowel, or to one of the free edges of the mucous folds, it becomes enlarged, and forms a sort of valve, bridle, or eccentric contraction, according to the form and direction of the inflamed tissue. At other times the inflammation leads to atrophy of a section of the bowel, so that its size may be diminished to that of an ordinary lead-pencil. We are further told that the several forms of stricture also arise from cicatrized ulcerations that have involved the mucous membrane in certain directions and extent.

Howship discourses in this wise of the manner in which stricture is formed:

"When a small mass of hardened fæces in the rectum is situated low down, with another above it, the part of the bowel between the two may have a tendency to contract itself in the vacant space. Should the irritation incident to loaded bowels cause the parts thus circumstanced to inflame, effusion taking place between the coats of the intestine will inevitably convert its temporary form into a permanent condition. The subsequent escape of the fæces is attended with violent pain, and the contracted part will always be irritable, because much exposed to annoyance from the perpetual transit of the contained matter. In this way I believe a sort of transverse valve or membrane is sometimes formed with a central opening, inducing most distressing consequences." *

In a note communicated to the Société Anatomique, M. Broca,† in speaking of a case, stated that a sort of plastic exudation in the form of two bands (traînée) embraced the rectum like a ring, and produced a valvular stricture. There is thus a new tunic superadded to the normal walls, and he thinks that the majority of valvular strictures are produced by a similar or analogous mechanism.

In another communication Dr. L. Aug. Mercier * affirms that the majority of rectal strictures are the product of an inflammation which has obliterated the capillary net-work of the bowel, principally of its muscular layer, by which it is transformed gradually into fibrous tissue.

The above explanations may be sufficient to account for certain cases of rectal strictures, but by no means all of them, nor, in my opinion, even of a majority. I believe the mechanism to be very simple, and that most strictures seated in the rectum are caused by a drawing in of the natural folds, or of circular strips when there are no folds of the mucous membrane, by the contraction of cicatricial tissue, repairing ulceration arising from either specific or common causes. In this way any loss of substance of the intestinal tunics, however small or occurring at any point in the walls, may produce a crescentic or diaphragmatic stricture during the healing process. In other words, the stricture in great part consists of the normal tissues displaced by contracting cicatrices. The anatomical relation of the mucous membrane with the muscular layer, connected, as they are, by loose connective tissue, favors the formation of stricture in this manner. In typhoid fever ulceration of the small intestines is common enough, and yet we never meet with stricture from this cause, as the mucous membrane is too closely connected with the subjacent coat to permit any displacement, so that the cicatrix formed from an ulcer located here is thin, shining, and flat. I regard the above view of the formation of rectal stricture as of considerable practical importance in relation to the operation of incision.

In Case VIII., the ulceration was originally located in the posterior wall of the rectum, marked by the limited area of hardened and fixed tissue that could be covered by the tip of the index-finger, the balance of the stricture being normal mucous membrane tightly stretched into the lumen of the bowel; this is the earliest stage of the stricture. Later, as the disease slowly advances, the passage of the fæces is gradually obstructed, causing more or less inflammation, which will occasion thickening and hardening of the displaced mucous fold and of the surrounding tissues. This advanced stage is represented by Case VII.

Were stricture cases clearly made out at an early period, before much change has been occasioned in the intestine walls, I believe that many of them might be submitted to the knife with the happiest result, no fear being felt that union of the edges of the wound would occur, inasmuch as they will widely gap from the resiliency of the divided tissue. In most of these cases also diarrhœal and purulent discharges are constantly passing through the rectum, and would militate strongly against any form of repair taking place in the wound, except that by granulation.

From this point of view, the advice of certain authors to thrust in a large bougie, and retain it there for some time, after rectotomy, would seem to be altogether unnecessary, if not positively injurious.

I prefer to wait several days until the wound begins to cicatrize, at which time contraction of the newly formed tissue can only occur. The chances of success of rectotomy will be greatly promoted by prepar-

ing the patient by three or four days of preliminary treatment, by the administration of laxatives and the daily introduction of one of the small rubber dilators far up the bowel, through which carbolized water may be injected in sufficient quantities to clean the intestine as thoroughly as can be done. During these few days the patient should be supported on fluid food, milk, beef-tea, and egg flip. When the operation is completed, opium may be given freely to relieve pain and quiet the bowels. The local dressings are of much importance—to prevent any of the intestinal excretions coming in contact with the wound, until the gap made with the knife and the surrounding connective tissue have become infiltrated up with lymph, which will occur in forty-eight hours or so, a piece of fine sponge secured to a curved gutta-percha tube opening beyond the sponge, the two together resembling in shape a mushroom, may be thrust into the rectum beyond the incision, and held in place by a tape tied to a waist-band. This contrivance will be, in most cases, easily borne for two or three days, and will give issue to wind, which often originates the desire to evacuate the bowels. It has another great advantage, and it is this, if any bleeding occurs the blood will fill the rectum and appear externally, when styptics may be applied on cotton wool in such quantities as to block up the rectal pouch.

As complications of rectotomy we find enumerated in the books a formidable array; as hemorrhage, fecal extravasation, abscess, fistula, pelvic peritonitis, pelvic cellulitis, peritonitis, and septicæmia. In srelation to these dangers the opinions of surgeons have differed greatly. Among the ancients the treatment of rectal disease in general was characterized by the utmost freedom of recourse to the severest surgical processes, if we are to believe that the judgment of Hippocrates either represented or influenced the prevailing practice. He says, "rectum enim intestinum et secans, et resecans, et consuens, et urens, et putrefaciens, etiamsi gravissima hæc esse videantur, nihil læseris." But the fact is, comparatively little was known of the nature, diagnosis, and treatment of the disease until the beginning of the eighteenth century. Without doubt, had stricture, by any accident been discovered in those times, it would have been incised, and, perhaps, many were thus treated, of which we have no record. The earliest case I can find is that reported by Wiseman.* He gives the history of a man who suffered from perineal abscess resulting in fistula, which was treated by both knife and ligature. As the wounds healed, stricture formed, "about an inch or more within the rectum." Dilatation with tents made of gentian and deer-suet was tried first, without avail. "The bowel being choked up," he says, "our work was the dividing the contracted callus, which made the stricture, which we did by an instrument made for the purpose, with which, without hurting the intestine, we cut through in several places, making the opening so large that the excrements came away big; and by the injecting of *ol. lubricorum*, cured the wounds in a few days after, and left him at liberty: he not only expelled them well, but also retained them; yet, within this twelve months, twice we have enlarged it, and by the instrument we designed, it may at any time be helped, without hazard of wounding the sound parts near it; but since the last incision of it, it hath continued open, and upon a late search with my finger, I could see nothing of it."

In the above case the obstruction was seated low, and there could have been no doubt as to the judiciousness of the operation performed, as there was neither danger nor difficulty to weigh against the hoped-for advantage of free issue to the fæces. The chief points in considering the applicability of the knife to non-malignant rectal stricture are two, its height and its width. The higher it is situated the greater the risk and difficulty of incision, and I am not aware that any case has been recorded in which a stricture beyond the reach of the finger has been so treated. Its situation decides the propriety of rectotomy for many surgeons, as Quain, Mayo, Salmon, Syme, and Bushe,* and the practice recommended by them is set forth fully by the latter. "When the stricture is near the anus, narrow and firm, the surgeon may hook it down with his finger, and then partially divide it, in two, three, or more points, with a hernial knife."

On the other hand, the dangers of incising strictures located high up, are believed by others to be greatly exaggerated; and ranged on this side are Howship, Copeland, and Calvert.† The latter of whom speaks in very decided terms, as follows: "When the stricture consists of a narrow indurated septum within reach of the finger, and the bougie either does not agree, or is a long time in effecting the dilatation, the best and shortest method is to divide it in the direction of the sacrum, and with a probe-pointed bistoury . . . . it is not attended with any danger, either from inflammation or hemorrhage; . . . . the division may be performed in one or more directions; but sometimes it answers the purpose equally, and is safer to divide the stricture towards the sacrum only."

As to the width of the stricture, it need hardly be remarked that the narrower it is, the more favorable for incision. There certainly is great variance in this respect, but in the greater number of cases the width will scarcely exceed half an inch, and in numerous instances the stricture is simply a bridle occupying a part of the circumferences of the bowel, or extending quite around under the form of a diaphragm with central aperture. Wide obstructions may be more advantageously treated by dilatation.

The incision may be single or multiple, and made at any part of the intestinal wall, though usually it is recommended as safer to incise posteriorly in the median line, and rather by several nicks at different parts than by one cut. With proper precautions, there is no doubt but that the rectotomy may be safely performed with the very best results at any part of the bowel within reach of the finger, and I am even sanguine that even strictures higher up may become manageable in the same way, with properly constructed instruments.

424 East Capitol St., Washington.

Dr. Pierre Berthier, Physician-in-chief to the Lunatic Asylum at Bicêtre, died on December 20th. From the very commencement of his medical studies Dr. Berthier's chief attention was directed to the subject of insanity, and he soon attained an enviable position in that specialty. He was the author of numerous valuable papers on insanity and its complicating affections.

CREMATION PRACTICALLY CONSIDERED.*

By CH. SMART,

CAPTAIN AND ASSISTANT SURGEON, U. S. ARMY.

In July, 1877. the writer was called in by his friend, Dr. John F. Hamilton, of Salt Lake City, to assist in conducting the cremation of the body of Dr. Charles F. Winslow.

Immediately on the completion of the process he proposed putting on record the points connected with it, but other matters occurring prevented him from carrying out the intention until the cremation seemed to have become too old a story to recount in the columns of our current literature.

Recently, however, the idea of reporting the case recurred with the force of a neglected duty, for though the cremation is a thing of the past, the practical questions involved in it are as new now as when they demanded solution at the hands of Dr. Hamilton himself, or as they would be to-morrow were some professional brother charged with the superintendence of a similar case.

It is not proposed to discuss the cremation *versus* burial question. The profession already knows most that can be said on the subject in its sanitary, economic, medico-legal, and sentimental aspects. But if the present writer can predicate of the profession as a whole from his acquaintance with individuals, it knows but little, at least in this country, of cremation from a practical point of view. And yet, as in this case, so in the next, medical men will no doubt be called upon to superintend the process. It is true cremations are not common with us, so the call to superintend one may be long in coming, but it is liable to come any day, and having come, it brings many anxieties which are by no means soothed by a recognition of the fact that, however private may be the arrangements, there are certain to be present many curious and critical eyes to oversee the process.

The report of this case may, therefore, be of use at some future day as a practical guide; while at the present it can stand as a contribution to the history in this country of the modern revival of cremation.

Dr. Charles Winslow, the subject of this cremation, was a resident of Salt Lake City, Utah, for several years before his death, and was considered a very able man, although credited by the public with some eccentricities; that is, he ventured to differ from public opinion on certain questions, and made no secret of the difference.

Among the various provisions of this gentleman's will was one requiring that within forty-eight hours after his death his heart be removed and placed in a preservative solution, and that thereafter his body be cremated in the most convenient manner, and with as little publicity as possible, under the direction of Dr. Hamilton, of Salt Lake City.

One of the executors of the will, Mr. Samuel Woodward, lived in Salt Lake City, the other, Mr. W. C. Pease, in San Francisco, California, while the relatives of the testator dwelt in the Eastern States.

Dr. Winslow died on the 7th of July, of valvular disease of the heart, and on the 9th the thorax was opened, under the direction of the resident executor, and the heart removed and disposed of as required by the deceased. No steps, however, were taken in the matter of the cremation until after the arrival of the executor from San Francisco.

During this time the body was kept on ice in the sexton's office.

On the arrival of Mr. Pease from San Francisco arrangements were made to carry out the provisions of the will so far as related to the disposition of the body.

A small furnace was planned, which was conceived ought to answer the purpose, but before orders were given for its construction, it was thought advisable to consult some of our mining men, whose practical experience in the smelters might offer some valuable hints. These approved the plan of the furnace, as a furnace (that is, their opinion was not required on its merits as a crematory), but presented the objection that such a construction would require at least ten days of a graduated heat to dry and season it, else it would break down under exposure to an elevated temperature. Coming from practical men this objection carried so great weight that the idea of the special furnace was abandoned as involving too much delay, and an inspection was made of several smelters in the neighborhood of the city with a view to finding a furnace which might be utilized. In the meantime, however, it having been suggested that, although the gradual heating and seasoning of a furnace intended as a permanent working structure was undoubtedly necessary to its permanence, the small cremation furnace might last long enough to perform the work required of it without any such lengthened seasoning.

After some hesitation and discussion this suggestion was acted upon, and a site having been obtained from the city authorities, the furnace was built in the course of a dozen hours and fired up to season it for its work.

A vacant lot in the centre of the city, between the theatre and Brigham Young's residence, was granted for the purpose. This site tended to give greater publicity to the cremation than was desired, inasmuch as the furnace had to be built under the very eyes of the populace; in addition, the local papers, having learned something of the *status quo*, endeavored to keep their readers posted on the matter. Yet, as the cremation was expected to be completed in the course of a few hours, it was hoped that by concealing the hour of the commencement of the process the affair might be an accomplished fact before the public became acquainted with it. The site, also, had the further disadvantage, in case of the evolution of any empyreumatic odors, of being under the nose of the populace, who would, no doubt, be much disposed to sniff the air when they knew what was in progress, and to be favorably or unfavorably impressed, according to the dictum of their olfactories.

After some sixteen hours of gradual heating the furnace was well coaled up, and in two hours more, when thoroughly heated, a hind quarter of veal and some bones, enveloped in a sack, amounting in all to about forty pounds, were thrown in. None of the idlers around the furnace were aware of what was consigned to it, and none discovered any taint in the atmosphere, save that from the coal-smoke when the fire was replenished. At the end of half an hour the soft tissues had disappeared, leaving a mass of incandescent bone, with some dark carbonaceous patches here and there among the crevices. At the end of an hour and five minutes, when the door of the furnace was again opened, the bones were found to break down under the weight of a long iron poker laid gently on them. The result was regarded as satisfactory; for, as one-sixth only of the floor of the furnace

* Being a report of the cremation of the body of Dr. Charles F. Winslow, which was effected at Salt Lake City, Utah, July 31, 1877, under the superintendence of Dr. John F. Hamilton, surgeon in charge of St. Mark's Hospital, Salt Lake City.

was covered by the experimental tissues, it was supposed that had the remaining five-sixths of the floor been covered in like manner, the cremation of the whole would have taken place in the same length of time. It was therefore determined, as the floor was being cleaned out, to keep up the heat and cremate the body in the evening.

Meanwhile, however, a telegram was received from the relatives of the deceased forbidding the cremation in most positive terms. Full particulars of the provisions of the will relative to this point were telegraphed back by the executors. One of the sons of the testator, Mr. Charles Winslow, of St. Louis, Mo., intimated his intention of coming to Utah, and requested that no action be taken until his arrival, but that the body be embalmed for future burial or cremation, as might be determined on.

The embalmment was accomplished on July 18th, by means of alcohol, carbolic acid, and chloride of zinc.

In a few days Mr. Winslow arrived, and having made himself acquainted with all the facts in the case, acquiesced in the action of the executors, and proceeded homewards to represent matters to the other members of the family, and gain their acquiescence to the willed disposition of the body.

In the meantime, while waiting for the removal of all sentimental objections to the cremation, the construction of the furnace which had been built, tried, and approved, had better be described.

Externally it had the appearance of a large brick box—eleven feet long, four wide, and five high—which, in addition to being well cemented, was bound together by long iron bolts and heavy timbers. It consisted of a stone foundation, brick walls, and fire-brick lining. From its upper surface, at either end, there arose a brick chimney about three feet high, on each of which was superimposed a twenty-feet metal smoke-stack; these, of course, being kept in position by strong iron-wire stays.

At the upper half of one end, which might be called the front of the furnace, was a semicircular iron plate, hinged below on its straight edge, and forming the door of the cremation chamber, which chamber was arched transversely in its ceiling, seven feet long, two feet wide, and two feet in height in the centre of the arch. The floor of this chamber, which separated it from the fire-place and flue, was a heavy boiler-iron plate, three-eighths of an inch thick, let into the brick wall of the furnace along its sides, and supported underneath by fire-bricks set on edge, their under edges resting on the floor of the flue.

The fire-place was under the fore part of the iron floor of the cremation chamber, its opening being at the lower and fore part of one of the sides of the brick box, while the flue ran backward under the iron flooring to the rear of the building, where it curved upwards past the rear end of the iron plate and cremation chamber to the brick chimney and smoke-stack, which projected it vertically upward.

So far as the flue has been described, it is evident that the draught would be from the fire-place back under the flooring of the cremation chamber, then upward past its inner or rear wall, and so into the atmosphere through the posterior smoke-stack, communicating heat to the chamber and its contents only through the flooring and end wall, thus making an oven of the said chamber, or rather a retort, as it had an exit pipe in the shape of a smoke-stack at its upper and fore part. Heat so applied would effect the destructive distillation of animal matters, not their oxidation. But the rear wall of the cremation chamber had an opening in it communicating backward into the flue, and this aperture was guarded by an iron plate which, on being raised or let fall through a transverse slit in the top of the brick box, opened up or shut off the communication between the flue and the chamber. This might be called the perpendicular valve. Again, in the chimney of the flue—the rear chimney, that is—a fissure in its wall admitted the driving home or withdrawal of a horizontal plate or valve, by which communication was cut off or opened up between the flue and the posterior smoke-stack. Thus, by pushing home the latter plate and raising up the former, the smoke, flame, and hot air of the flue, instead of escaping by the rear smoke-stack, would be turned into the chamber, converting it into a reverberatory furnace, in which oxidation of contained material would be accomplished by oxygen in the air, which had passed through the fire and flue and escaped consumption by the fuel used.

The smoke-stack at the fore part of the furnace was thus the real stack of the crematory, that at the other end having been added simply for convenience in clearing the chamber, when required, of its smoke, flame, and heated air.

The essential of a cremation furnace being understood to be a chamber which will furnish at the same time a strong heat and a free supply of air, it is manifest that the construction above described provided only the first of these in perfection, the air supply for the chamber consisting only of the residual oxygen which escaped combination in passing through the fuel. Yet this was presumed to be sufficient for the purpose, and by the trial above recorded the presumption was sustained. In case, however, of delay in the oxidation of the last portions of the carbon, provision was made for an increased influx of air by having on hand a fan wherewith to institute an artificial blast. It was recognized, also, that the iron flooring of the chamber would withdraw from the organized material to be oxidized much of the residual oxygen, by its strong affinity, at a high temperature, for that element. Yet, as the iron flooring was more easily laid than one of fire-clay tiles, it was approved and found to fulfil the requirements of the occasion.

In each side of the reverberatory chamber was inserted a small mica window for the purpose of observing the progress of the crematory process, but they were found of little value. The best observations were made through a circular aperture, one inch in diameter, in the semi-circular iron plate which formed the door of the chamber. The aperture, when not used as an observatory, was closed by an iron slide. The view through it, when the chamber was cleared of smoke and flame by tilting the current through the rear smoke-stack, was very satisfactory. All official observations were made by means of this aperture, and the mica windows were given up to the curious eye of the public.

Such having been the furnace prepared for the cremation we may now recur to the story of its use.

On the 30th of July a telegram was received conveying to the executors the acquiescence of the relatives, and the cremation was set for five o'clock of the afternoon of the following day.

The body, in the meantime lying on ice in the city sexton's office, had lost in weight by evaporation, on account of the warm weather, from 180 pounds at the time of death to 139 pounds at the date of cremation.

By the building and trial of the furnace, the comments of the local press, and the objection of the relatives to the cremation, public curiosity was roused to

its utmost, and the appointed hour found the vacant lot crowded with people.

A number of carriages, containing the pall-bearers and friends of the deceased gentleman, called at the sexton's office and conveyed the body to the furnace enclosure. Here it was exposed, wrapped in a simple linen shroud, the face pale, firm, preserving all the natural lines, and looking more like a marble cast of Dr. Winslow than his mortal remains. Some ladies who were present laid bouquets upon the body, and Dr. Hamilton, General Moses M. Bane, and the writer, followed each other in making remarks appropriate to the occasion, which belong, of course, more to the daily news account of the ceremony than to the pages of medical literature.

The body was then prepared for the furnace by being placed upon a one-eighth inch iron plate, which was six feet long and twenty-two inches wide, with its edges turned up about an inch to convert it into a shallow tray. The original intention was to have placed the body directly on the floor of the furnace, and to have raked the ashes out after cremation, but the heat to which the furnace had been subjected during its trial, and in firing up for the cremation previous to the interference of the relatives, with the subsequent cooling, had done much to damage it. The expansion and contraction of its metal flooring had slightly loosened the brick-work, but the chief result was the tendency to cave in of the unsupported parts of the floor. As it was feared that the heat, during cremation, would so increase this as to render it difficult to rake the ashes out over the uneven surface, the sheet-iron tray above mentioned was improvised.

The laden tray was borne by the pall-bearers on three staves to the open door of the furnace-chamber. The smoke and hot air had been turned off through the rear smoke-stack preparatory to this procedure. The head end of the tray was then rested on the edge of the iron floor of the chamber, and, with a steady, onward movement, tray and body were carried into the furnace, each pair of pall-bearers dropping their staves and stepping aside as they reached the door. A few seconds only elapsed from the moment the head end of the tray was rested on the edge of the furnace until the door was shut upon the subject; so few, that the most critical observers could only see the gradual but rapid browning of the shroud, and a flash of flame catching it as the door was closed.

The perpendicular plate was immediately raised and the horizontal one driven home, permitting the smoke and flame to roll along the chamber, lapping the body, and make its exit through the anterior smoke-stack. Nothing could be seen through the mica windows save the wave-like masses of flame; but a rapid, crackling sound, owing to the dissipation of the water of the tissues, was heard for many minutes. In the smoke was noticeable an odor of carbolic acid, due to the vaporation of the carbol used in embalming. This gave occasion to the *Salt Lake Herald* to remark that every offensive odor was observed during the cremation; but the only odor present was the carbolic, and this was so slight, or so assimilated in character to the coal-smoke in which it was disseminated, that a majority of the people failed to observe it. Anyhow, it was of no lasting duration. During the greater portion of the time occupied by the cremation there was no trace of odor.

At the end of half an hour the flame was turned off through the posterior stack, and an observation made through the hole in the iron door, discovering the ribs and the bones of the lower extremities to be denuded of soft parts; but the hips, trunk, and head were yet covered with carbonaceous masses.

At the expiration of an hour, as the skeleton seemed to have been freed from all black masses or streaks, the door of the chamber was opened for a thorough inspection, revealing the incandescent skeleton with a few dark patches still persisting about the hips and upper part of the trunk.

During the succeeding hour the bones fell apart, becoming broken in their fall, and were more or less crumbled by the continuance of the heat. When the door was opened at the end of this hour, the cremation might have been considered completed. The poker, placed gently on some of the prominent bony masses, crushed through them by its weight. But as thorough success was desirable, and as the artificial blast had not yet been put in requisition, it was determined to give the remains half an hour longer of the heat, with the increased air supply produced by the fan.

During this treatment the bones glowed in their incandescence, but little further change was noticed in their aggregation.

At the expiration of two hours and thirty-five minutes the fires were raked out and the door of the chamber opened, shortly after which the tray was extracted and placed on wet ground to cool. In about half an hour the remains were ready for collection.

The influence of the heated air on the iron plate was now manifest in the numberless flakes of heavy iron oxide which were swept up in collecting the ashes. They constituted about one-fifth in weight of the debris. This result, it must be confessed, had not been foreseen. The loss of active cremative air by the presence of the iron had been appreciated and accepted before the process was initiated; but the flaking up and adulteration of the ashes by the oxide had not been thought of until it was presented in the process of collection. However, the separation was readily effected. Most of the flakes were large and removable by the fingers. Smaller pieces did not yield to the trituration required to reduce the friable bones to powder, and were separated by passing the dust through a coarse-meshed sieve.

None of the bones were complete, but many of the pieces were large enough to enable their derivation to be easily recognized. Some spongy pieces were beautiful specimens of whiteness and delicate lamination.

The result was three and a half pounds of ashes, weighed, urned, and labelled within four hours after the consignment of the body to the furnace.

In view of this fact we must credit the furnace with having done the duty for which it was intended in a very satisfactory manner, although it labored under the disadvantages of a deficient air supply, and an iron flooring which deteriorated the quality of the air. Were a permanent crematory to be called for, Dr. Hamilton and the writer coincide that the furnace above described would fulfil all the requirements, provided the floor of the chamber was made of fire-clay tiles, and a hot-air supply furnished by means of a fire-clay pipe running underneath the flooring, and debouching on the rear wall of the chamber beneath the throat which communicates with the flue.

The cremation was virtually finished in two hours by the furnace in question, notwithstanding its defects; with those defects remedied it is safe to say that two hours would be the maximum time required per body for cremation.

In order to determine the thoroughness of the cremation to which the body of Dr. Winslow was sub-

jected, a sample of the ashes was examined by the writer with the following result:

Phosphate of lime	85.06
Magnesia pyrophosphate	1.60
Lime sulphate	1.77
Lime carbonate	11.04
Sodium chloride	.17
	99.64

A trace of the lime existed in a free state as quicklime, but it and traces of iron were not determined, on account of the small quantity of material available for investigation.

The analysis shows the entire dissipation of the organic matter, even of the various salts which are incorporated with it, a trace of chloride of sodium, from the organic tissue of the bones, alone remaining.

Fluoride of calcium, which exists to the amount of two per cent. in bone, has disappeared from the ashes—the lime of that salt having combined the sulphate with the acid from some of the broken up sulphates of the organic tissues—as lime sulphate is not a constituent of ordinary bone.

The magnesia pyrophosphate in the ashes, as might be expected, does not differ in quantity from that yielded by bone.

Lime carbonate exists in smaller proportion in the ashes than in bony textures, part of it having probably been carried off by the draught of the furnace; while the deficiency of lime-carbonate and sodium chloride is replaced by an excess of the lime phosphate, of which eighty-five per cent. is yielded, instead of seventy-six per cent., the average in human bones deprived of their organic matter.

A SHAWL-PIN LODGED IN THE LEFT BRONCHUS FOR THIRTY-THREE DAYS.

SUCCESSFUL REMOVAL BY OPERATION.

By EDWARD J. ILL, M.D.,

NEWARK, N. J.

On November 3d my father, Dr. Fridolin Ill, was called to a child, Lizzie Gaus, aged six years, with the history that the child had swallowed a pin on Oct. 30th. The mother had administered several doses of castor-oil without the desired effect.

At this time the child had a croupous cough, but nothing could be detected in the pharynx except a small scratch on the left anterior pillar of the palate. A most careful examination of the lung revealed nothing at this time. The child now became feverish.

On Nov. 8th, the fever abated somewhat, but the hoarse cough still remained and became very irritating, purulent bronchitis showing itself.

On Nov. 27th, my father noticed the respiratory noise on the left side to decrease in force, and a slight dulness on percussion over the lower left lobe.

On the 28th, I was asked to see the child with my father; but the patient was taken to one of the clinics and we missed seeing it that day. On the 29th we were asked to see the child again. Now we discovered a slight dulness on percussion, a check at the beginning of inspiration and at the end of expiration, and a constant whizzing sound during inspiration and expiration over the left bronchus anteriorly; decreased fremitus over the whole left lung; a slight dulness on percussion over the lower part of the lower left lobe; decreased respiratory murmur, and numerous râles over both lungs. Fever was very little at this time, but the constant irritating cough which had been present from the beginning had increased. The hoarseness was very slight.

Having gained the confidence of the child, I proceeded to make a laryngoscopic examination. The result was negative, although I gained sight of all parts down to the vocal cords.

I furthermore found that the child, having the head of the pin in its mouth, suddenly gaped, and the pin disappeared.

The diagnosis now was: Pin lodged in the left bronchus with the point upward. To verify the diagnosis, we observed the case for two days longer, always finding the same symptoms, the laryngoscopic examination always negative.

On the evening of Dec. 1st signs of pneumonia set in, and we immediately prepared for an operation to remove the offending cause. In the presence and with the assistance of my father, Drs. Stachlin, O'Gorman, and Lehlbach, I performed the following operation on Dec. 2d:

Tracheotomy, with an incision of one inch, and an opening into the trachea, of from the second to the fourth ring included was made. A most forcible coughing took place, which lasted throughout the whole operation, and was not controlled even by the most profound anæsthesia. I first made search for the pin with a probe, which was introduced into the trachea for nearly four inches, and immediately struck a body which I took to be the pin. I then handed the probe to my friends, but they obtained a negative result.

Again I examined the trachea, and with the same positive result. I now introduced a dressing forceps, bent upon the flat about half an inch below the handle, and was able to catch something between its fangs, but unable to bring it up. To make the story short, I caught hold of the pin, pressed it downward and to the left, thus disentangling the point and bringing it out of the trachea. The pin is one and three-quarters inches long, and the head one-quarter inch in diameter.

The whole operation, including the anæsthetizing, took one hour and twenty minutes. The purulent bronchitis soon abated and the pneumonia resolved. On Dec. 28th I dismissed the child cured.

NEWARK, N. J., Jan 4, 1878.

A CASE OF GREATLY ELONGATED CERVIX UTERI AT FULL PERIOD OF GESTATION.

OS INCISED AND FORCIBLY DILATED TO ADMIT OF DELIVERY.

By A. R. BARTON, M.D.,

JAMESTOWN, N. Y.

About 3 P.M. of the 10th of July, 1873, I was called to see Mrs. M——, a native of Ireland, aged about 33 years, who was supposed to be in labor with her fourth child. As near as she was able to tell, she was at the full period of gestation, and the membranes were ruptured forty-four hours previous to my visit, but no pain had occurred until about 6 o'clock in the morning of the day on which I was called, when she had a few slight irregular pains, and a continuous pain in the sacral region, which had not left her at the time of my visit. Soon after the commencement of this pain she had a chill, followed by fever and profuse sweating. At time of my visit, pulse was 100; temperature, 101.4°; skin, hot and moist; tongue,

slightly covered with yellow coating; bowels, acting naturally.

In attempting an examination per vaginam, I found protruding from the labia a large tumor, which, on inspection, proved to be the neck of the uterus, so greatly elongated as to protrude full four inches, by measurement, from the vulva. It measured in circumference eight inches. The os was sufficiently dilated to admit of index-finger by using very little force. The tissues surrounding the os, extending to the outer surface of the tumor, and running back an inch or more, were dense and hard, almost cartilaginous. The vaginal tissues covering the tumor were hard, hypertrophied, dry, and as smooth and shining as the integument on the thigh. There was no ulceration, excepting at one point on the anterior lip and near the os, where there was a small ulcer of about two lines in diameter. The finger carried into the cavity of the tumor discovered nothing more than a continuous canal. Even when the tumor was carried up on the finger as high as possible, the child could not be reached. The fundus of the uterus was well up into the epigastric region, and the abdomen was as large as that of women ordinarily at full term of pregnancy.

My questions elicited the following history of the case: Previous labors were natural, easy, and very short. Patient's health has always been good previous to the fourth month of present pregnancy, when, after walking four miles, and carrying a heavy package, she felt a great weight, or "bearing down" in the pelvis. This condition continued for many weeks, and soon after its commencement her attention was called to a prolapsed condition of the womb by presenting itself at the vulva. From this time there was a gradual elongation and growth of the organ until the end of the fifth month, when, she says, it protruded at least one inch more than it did at the time of my first visit, and continued thus until the last days of gestation, when she was obliged to keep her bed some, and the tumor receded a little. During this time the abdomen gradually enlarged, showing that the body of the uterus was following the natural course of that organ during gestation. The cervix had not been replaced or returned to its normal place for more than four months, during all which time she had attended to her domestic duties, and attended to all shopping for the family. At first she would replace it, or return it inside the vulva on retiring for the night; but, after a little while, it refused to stay there, and she abandoned the practice. There was slight pelvic tenesmus, or dragging downward of the pelvic contents, and constipation. The bearing-down pains were aggravated by walking, standing, or lifting of heavy weights. There was no more pain in back or limbs than is frequently experienced in normal conditions of pregnancy. There was no difficulty in urinating, but occasionally a little more frequent repetition of the act. The most she complained of was the weight, or dragging sensation, and the interference it offered to the movements of her limbs.

An attempt to reduce the deformity resulted in its being returned within the vulva, where it remained. Rest in the recumbent posture was enjoined, and I left, with instructions to call me as soon as the pains became severe. At 11 P.M. of same day, a messenger came, stating that the pains returned at 6 P.M., and had continued quite regular and frequent and at that time were quite severe. Being in attendance on another case, to which I had been previously called, I could not leave for a couple of hours, and advised them to call another physician. At 3 o'clock on the following morning, after I had returned to my home, I received another call to see the woman, the messenger stating that she was still undelivered, and that they had been unable to procure other assistance, except a half-dozen or so of old women, whom I found standing around the patient's bed, wrapt in bewilderment at the sight of the strange phenomena of a child's head being outside of the vulva, yet as far from their reach virtually as it was when in the mother's abdomen. I learned that the pains had been frequent and severe for three or four hours previous to midnight, but from that time they had been less frequent, but quite regular, occurring on an average of once every five minutes. I found the uterus prolapsed, and lower than at the time of my previous visit. The child's head, enveloped in the neck of the uterus and the vagina, protruded about half its size from the vulva, but every pain or contraction of the uterus forced it completely outside the vulva, and then as the pain subsided it would recede to its former position. This shuttle motion had been going on for three hours. The os was dilated to nearly the size of a silver quarter, but the tissues surrounding it were as hard and unyielding as ever. There had been some hemorrhage, which led me to fear that the placenta might have been sufficiently detached to endanger the life of the child, although I could still hear very indistinctly the placental souffle and the heart-beats of the child. The patient's condition, aside from that referred directly to the uterus, was much better apparently than at the time of my first visit.

Recognizing the inability of nature to relieve the woman unaided, and the necessity for immediate action for the safety of the child and the comfort of the mother, if not her safety also, I set about dilating the os uteri. First, with one finger of each hand, and afterwards two fingers, introduced within the os, I made forcible distention by drawing in opposite directions, and thus, after an effort of half an hour or more I succeeded in dilating it to the size of a silver dollar, but not without rupturing the tissues at two points. Seeing that I could make no further impression on it without danger of perhaps serious rupture, I took a bistoury, and carrying the point back fully an inch and a half on the inside of the cervix, brought it out through the tissues at a point about one-half inch from the end on the outside of the tumor. These incisions I repeated about one inch apart all around the os, and finding they did not admit of sufficient dilatation to allow of the passage of the head of the child, the incisions were repeated between the others until ten in all were made. Then grasping the head of the child with one hand, at the time the uterine contraction forced it beyond the vulva, and with the other making forcible retraction of the cervix, in the same manner one would draw over the finger a tight-fitting glove, I finally, after several efforts, succeeded in delivering the woman of a living female child, of about 7¼ lbs. weight, but not without the further rupturing of the tissues, extending from two or three of the incisions. The loss of blood was comparatively slight from the incisions. The placenta followed in a few minutes, the uterus contracted well, and the whole loss of blood was no more than is usually met with in cases of parturition. The body of the uterus could be as distinctly felt above the pubes as is generally the case immediately after delivery, while the neck of the organ still protruded from the vulva at least four inches. After bathing the tumor in cold water, and on examination to see that none of the ruptures involved other tissues, I carefully reduced it, elevating it as high as possible. I left the woman

quite comfortable, aside from an occasional after-pain, for which I administered ten grains of Tully's powder, and gave orders to repeat it if necessary. Pulse, 72. Skin cool. There was a partial laceration of the perineum, to remedy which I could not get the patient's consent for the introduction of a single suture, although absolutely required to remedy the prolapsus.

As a detailed history of the case and its management from this time on may not be of much interest or practical value, I will give but a brief synopsis of it.

Following delivery the patient had more or less febrile disturbance, followed by profuse sweating, as she had the day before delivery, with rapid pulse, elevated temperature, anorexia, etc.; but with the exception of a little tenderness in the hypogastric region, there was no unpleasant symptoms referable to the uterus as the cause or seat of difficulty. The lochia remained free and natural for a week. Vaginal injections of warm water impregnated with carbolic acid were used three times a day. Saline aperients, mineral acids, and other tonics completed the treatment, and in sixteen days she was about the house doing her work. The behests of poverty overbalanced my authority and influence, and she could not be induced to keep quiet any longer. The uterus at this time was well up in the pelvis, nearly or quite to its normal position. In three days after getting up it had descended to within an inch of the vulva, and the vagina prolapsed an inch or more. One week subsequently, I found the uterus prolapsed three inches from the anterior commissure of the vulva. The incisions had all united very perfectly. Rupture of perineum had nearly healed by granulation. The tissues around the os were hypertrophied and indurated. Vaginal walls hypertrophied. Tumor, 7¼ inches in circumference. When returned into the pelvis it immediately followed the finger back unless the patient was on the back with hips elevated. There was no perceptible discharge from the uterus.

Such was her condition the last time I had an opportunity to examine the case. She would not consent to any treatment looking towards a removal of the deformity. Said she would rather remain in that condition than have more children, for a drunken husband might yet compel her to provide for those she had. A few months subsequently she came with complaints of backache and a dragging sensation in the pelvis, but still declined surgical interference. About this time she passed from under my observation. I, however, learn from a trustworthy source that without ever having had any treatment whatever, she again became pregnant, and in a little more than two years from the time of the birth of the child herein mentioned, she gave birth to another at the full period of gestation, the labor being normal.

Dr. E. Gintrac.—By the death of this gentleman, the medical faculty of Bordeaux has lost its oldest and one of its most universally respected representatives. He was known to science as the author of valuable papers on obliteration of the portal vein, cyanosis, and other pathological subjects, and also of an extensive work entitled *De Pathologie interne et de Thérapie médicale*. This work gained for him the title of Corresponding Member of the Académie des Sciences, and gave him a distinguished rank among scientific men. Dr. Gintrac was an admirable clinical teacher. He had been the instructor of most of the present professors of the school of Bordeaux, and in many ways rendered great service to that school.

Progress of Medical Science.

A Case of Noma in which Moving Bodies were Observed in the Blood During Life.—The notes of this case were communicated to the Royal Medical and Chirurgical Society by Dr. Sansom. The patient, a little girl, æt. four and a half years, was admitted into the North-Eastern Hospital for Children, under Dr. Sansom and Mr. Fay, on Feb. 12, 1876. Her disease commenced a fortnight before admission, with pain in the left cheek. Very great prostration occurred, and increased until admission. Sloughing rapidly took place, the cheek became perforated, and the inferior maxillary bone necrosed. Copious hemorrhage ensued on the third day after admission; on the same day broncho-pneumonia set in. The child died the eighth day after admission. The post-mortem examination revealed very extensive necrosis of the tissues surrounding the left cheek and left side of the tongue, and necrosis of both superior and inferior maxillæ. The bases of both lungs were consolidated. The first microscopical examination of the blood during life was made on the third day after admission. The white elements were in excess, and many existed in fragmentary condition. Examined by a high power, a large number of small, highly refractile bodies, resembling minute colorless crystals, were seen in active movement. Reagents acted upon them variously; weak solutions of carbolic acid, and of quinine arrested their movements; weak solutions of potash and of sulphuric acid stimulated them. The number of these motile bodies varied greatly at different times. After hemorrhage and fall of temperature they were greatly reduced in number; again, when the temperature had risen to 103° F. they were in great abundance. When numerous they tended to form groups resembling zoogloea. In size they were one-twentieth part of an ordinary red blood-corpuscle. Shortly before death, ordinary bacteria were observed in addition to the translucent bodies. Similar translucent bodies were found in the urine examined immediately after being voided; and a large number were seen in the fæces. The discharges from the wound also manifested them in abundance. Investigations concerning the infective character of the blood and secretions were commenced on the second day after the child's death; the fluids preserved for inoculation having been kept in sealed capillary tubes. A healthy mouse, inoculated with blood from the right auricle, died on the day following, and on examination showed evidences of peritonitis, the exudation containing a large number of motile bodies, exactly resembling those present in the blood of the child.

A Guinea-pig, treated in the same way, died five days after the operation; its blood contained a vast number of the special translucent bodies. Inoculation of the fluids from the seat of the noma was practised upon a mouse and a cat. Both animals died, and there was a complete absence of the motile translucent bodies from their blood. It would appear, therefore, that whilst inoculation of the fluids derived from the diseased tissue produced peritonitis without discoverable alteration of the blood, inoculation of the diseased blood induced septicæmia, with the manifestation of the characteristic motile particles observed in the original disease. The organisms resembled amœbæ rather than bacteria. — *Medical Examiner*, October 25, 1877.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, February 16, 1878.

LIBERALISM IN HOMŒOPATHY.

THE resolutions recently passed by the Homœopathic Medical Society of the County of New York are a striking indication of the tendencies of the times. They say in effect that the dogma "similia" is no longer capable of universal application, and that, as honest physicians, the homœopaths are obliged to rely to a greater or less extent upon the practices and methods of the older school. In other words, they no longer desire to be considered as exclusives.

For many years it has been a matter of common notoriety that professing homœopaths have not infrequently availed themselves of the teachings of regular medicine, and applied them in purposely disguised forms. The inconsistency of such a course has undoubtedly led to much of the ill-feeling which we as a school have borne towards them. The present honest declaration, that homœopathy, pure and simple, is not all that their earlier fancies painted it, is simply a public admission that the sectarian position formerly assumed by them is no longer tenable; that duty to their patients requires them to become physicians in the broadest sense, and not blind followers of a creed nor worshippers of a man. That honesty, learning, and ability, possess many representatives in their ranks is unquestioned, and we welcome the resolutions as a desire on their part to return to the ranks of a catholic profession, broad enough, as its earlier records show, to embrace and give trial to any views, when presented in a spirit of scientific moderation, and when not accompanied by too great demands upon ordinary credulity.

THE COLUMBIA HOSPITAL CONTROVERSY.

WHILE criticism of minor deficiencies in the administration of hospitals and asylums ought not to be admitted into the columns of a medical journal, and while defects, arising from causes beyond the control of medical officers or from the infirmities of human judgment, may properly claim the immunity of kindly silence, it is our bounden duty, however ungracious the task, to call upon medical boards and superintendents for an explanation in instances of public institutions, where apparently well-founded allegations of mismanagement or corruption are made. In exercising this duty, it fell to our lot, several weeks since, to take notice of a pamphlet, understood to be written by a distinguished physician in Washington, charging serious maladministration upon the Columbia Hospital for Women and Lying-in Asylum, while Dr. J. Harry Thompson was officially connected with the institution as surgeon. The charges were of such gravity, and so specific in their details, that the omission to explain them scarcely admits of any interpretation save confession of their justice. In noticing the allegations of the writer, and summarizing them, it was distinctly stated that our article was in the nature of a *résumé* of what had already appeared in the *Louisville Medical Journal*, and distinctly intimated that any sufficient answer to them would receive immediate attention. In lieu of such a vindication as the circumstances demanded, a copy of the report of the Columbia Hospital for the fiscal year ending June 30, 1877, was forwarded to this office. This report, when critically examined, was found not only to contain no materials for the refutation of the charges, but to furnish the data to verify them in many important particulars. This fact was kindly stated in a brief editorial, and the managers were assured in very direct terms that, while the facts and figures of the report apparently sustained the writer of the pamphlet in all material points, the columns of THE MEDICAL RECORD were at their service, if substantial injustice had been done.

Since then a pamphlet reprint from an article in the January number of the *Louisville Medical Journal* has been submitted to our inspection, in which the writer—understood to be the same as the author of the preceding article—enters upon a thorough analysis of the figures of the report, points out several grave discrepancies, and asks that sums to a considerable amount be duly accounted for. For details, readers must be referred to the pamphlet or to the columns of the journal in which the article appeared. It is not to our purpose just now to reiterate statements already accessible to those who have an interest in the management of the Columbia Hospital; but it is distinctly within our purpose once more to advise the gentlemen in charge of that institution that they are of such gravity as to call for specific denial and specific explanation of the figures upon which they are based. Of course it is beneath the dignity of medical men of established reputation to take notice of vague intimations of maladministration, or of unsupported charges, unless they appear in journals of distinguished professional stand-

ing. But there are occasions when, distasteful as it may be to physicians conscious of the rectitude of their intentions, silence is liable to be misinterpreted; and the gentlemen whose administration of the affairs of the Columbia Hospital is impugned are profoundly mistaken in permitting notions of professional dignity to prevent them from repelling charges that imperil their reputation as honorable men, and from publishing the fullest vindication of their acts. Perhaps—the intimation is tendered in all sincerity—the easiest way to vindicate the management of the hospital is to demand an investigation, and to insist that it be thorough and authoritative. There are many members of Congress who would not object to serve upon a committee for that purpose, and such a disposition of the affair is not derogatory to professional dignity.

GYNÆCOLOGICAL STATISTICS.

THE twenty-second annual report of the Woman's Hospital in the State of New York presents one feature that is decidedly worth the attention of gynæcologists—namely, a carefully prepared tabular statement of all the cases treated in the institution from its foundation, and the results in each case, thus giving a retrospect of twenty-two years in the treatment of diseases peculiar to women. During this long period, from December 31, 1855, to December 31, 1877, the total number of cases recorded has been 2,153, of which 1,049 were cured, 729 improved, 81 not improved. In 210 cases the result is not recorded. The deaths were 84, or a trifle less than 4 per cent. of the admissions. A glance at the statistical exhibit of diseases furnishes a certain species of information—respecting the relative frequency as compared with each other of the principal disorders peculiar to women—in which the profession at large is probably somewhat deficient, and which, therefore, is worth summarizing. The table opens with 4 cases of uncomplicated hysteria. Diseases of the labia furnish 10 cases; deranged menstruation, 54; metrorrhagia, 3; fissure of the os uteri, 1. Ovarian diseases are responsible for 22 cases, of which 16 were ovaritis. Laceration of the perineum occurs in 142 cases; extra-uterine pregnancy in 1. Diseases of the rectum, 20; tumors—cystic, fibroid, and ovarian—203; polypi, 36; urethral diseases, 18; uterine diseases, 970; vaginal, 98. In all, since the hospital started, 1,247 operations have been performed. Pages 54 to 81, inclusive, embrace a complete analysis of the diseases of which a summary has just been given, with notes respecting the causation in each case, the mode of treatment adopted, and the result. Cystotomy has been performed 17 times, with 4 cures. Closure of recto-vaginal fistula has been undertaken in 19 cases, with 14 cures; of vesico-recto-vaginal fistula in 9 cases, with 7 cures. Of the 52 ovariotomies, 26 recovered and 26 died. In one case both ovaries were successfully removed.

This brief summary of Dr. Beekman's valuable collation must suffice. Although it is necessarily very incomplete and unsatisfactory, it will serve to indicate to the profession that a really valuable contribution to science has been made in the compilation of the tables, which are particularly specific in their description of the modes of treatment adopted in the various diseases, and their comparative results. Of the 25 cases of dysmenorrhœa, for instance, in 16 the cervix was divided, with 11 cures, and the rest improved. The three principal causes of death have been hemorrhage, peritonitis, and septicæmia—the first having 8 cases, the second 41, and the third 18.

The medical board reports 232 admissions during the year, and 174 operations, with a mortality of 7.

Reports of Societies.

NEW YORK ACADEMY OF MEDICINE.

OBSTETRIC SECTION.

Stated Meeting, January 21, 1878.

DR. ISAAC E. TAYLOR, CHAIRMAN.

NARRATION OF CASES—CASE FOR DIAGNOSIS.

DR. BUTLER related a case as follows: A male child, born in normal labor, with no physical defect apparent, had a semi-idiotic appearance, and had not made any attempt whatever at co-ordinated movements, not even to raise the head, when he was two years and three months old. He was supposed to be still-born, but persistent efforts brought restoration. He had been bottle-fed. The skin was translucent, veins showed plainly, sutures were well united, head normal in size, abdomen slightly enlarged. There was difficulty in deglutition, and the stools were curdy. No known attempt had been made on the part of the child to raise a hand or foot. There was a slight tonic muscular contraction constantly present; at times quite severe spasms, and yet there seemed to be some measure of paralysis. The skin could be pinched without giving rise to the least complaint, unless the pinching was very hard, when a moderate recognition was given.

Treatment.—The diet was changed from milk to beef-tea; bismuth and pepsine, alternating with the tincture of iron, were administered, and the bowels were kept soluble with salines.

At the end of six weeks the character of the stools had changed, the appetite had improved, and cod-liver oil was administered. At the end of two months the salines were discontinued, the appetite was fair, and the boy began to brighten. At the end of four months he was able to sit up. At the end of six months he began to creep. When he began to creep he would occasionally lay his head upon the floor and intentionally bump it. He was then taking nux vomica with the iron. Both remedies were discontinued, and the symptom disappeared. In less than one year the child began to walk by the aid of a chair, and said "papa" and "mamma." There was no evidence of rachitis.

DR. TAYLOR asked what the presentation was, and Dr. Butler replied that it was vertex.

HEMIPLEGIA AND PARAPLEGIA—BREACH PRESENTATION—OCCIPUT POSTERIOR.

DR. TAYLOR referred to cases of hemiplegia and paraplegia that had come under his observation, and associated with breach presentation and presentation with the occiput posterior. In such cases there might be improvement, but it was usually slow. The explanation given was, that in breach presentation the head might not rotate as did the shoulders, and the consequence was a twisting of the neck. In occipito-posterior presentation it was not certain that the shoulders rotated at the same time with the head, and the same consequence followed. This was regarded as a quite frequent cause of the death of the child in these presentations.

TAPE-WORM—CHILD TWO AND A HALF YEARS OLD.

DR. TAYLOR reported a case of tape-worm occurring in a child two and a half years of age. The child had no symptoms of worms, except that it did not seem to be very bright. It was thought by the mother to have pin-worms, but upon investigation it was found that joints of tænia solium were being passed.

The worm was removed by the use of turpentine and castor oil. About thirty feet were obtained, and it was thought the entire worm was expelled. The joints presented the appearance seen in both the tænia solium and the tænia lata.

RETAINED PLACENTA.

DR. CARO related a case in which the placenta, after an abortion, was retained six days without accident. His plan of management had been non-interference, except the administration of occasional doses of ergot.

DR. TAYLOR regarded it as a proper method of managing the placenta under such circumstances. He did not resort to forcible removal of the placenta, if retained after abortion, because such procedure was dangerous. If flooding was present, the tampon was the most serviceable means for arresting the hemorrhage. He had seen cases of abortion in which the placenta had been retained two, three, and five years. He once went to remove a supposed uterine polypus, but when in hand it was found to be an old placenta. The only symptom had been an occasional hemorrhage.

DR. W. T. WHITE asked whether or not it was proper to remove the placenta at any period of abortion.

DR. TAYLOR replied that the best method was to let it alone. It was not so dangerous to interfere when the placenta was retained at full term. When he had interfered and forcibly removed the placenta after abortion, the patient had generally been troubled subsequently with metritis.

CRANIOTOMY—PECULIAR DEFORMITY OF THE PELVIS.

DR. TAYLOR related a case in which the pubis dipped inwards instead of outwards, and rendered craniotomy necessary.

The case was interesting as one illustrating the fact that it did not necessarily follow because the forceps had been applied extreme traction should be made. If, with quite powerful traction, the head could not be moved, it was best to remove the forceps and wait a few minutes; then reapply them, and it would usually be found that at the second application the head could be moved by the use of a very reasonable degree of traction.

The case also illustrated the fact that it was not necessary to wait until the mouth of the uterus was fully dilated before applying the instruments.

CONVULSIONS IN CHILDREN—HYDRATE OF CHLORAL.

DR. HUBBARD related a case of convulsions occurring in a child two years of age. They were supposed to be due to malaria. The case was related to illustrate the good effect produced by the hydrate of chloral in the management of convulsions in children. The child was unable to swallow, and grs. v., in solution in water, were injected into the bowels, with the most satisfactory results. There was no evidence of meningitis. He had used chloral with success in cases in which chloroform had failed to control the convulsions.

DR. DOWNS remarked that he had employed the remedy, in doses of 15 to 20 grains, in the management of puerperal convulsions, and the dose was repeated every half-hour, if the convulsions continued.

He had also used it, in 1, 2, 3, or 4-grain doses in the treatment of convulsions in children, and in both instances with good results.

DR. TAYLOR remarked that he had always been somewhat timid with reference to using very large doses of hydrate of chloral.

DR. CARO regarded the use of hydrate of chloral in cases of hydrocephalus as certain to produce a fatal result, because it removed what little blood there was left in the brain. In the treatment of any case in which there was no congestion, it was almost absolutely certain to produce death.

The same principle held good in its use in the treatment of delirium tremens. If there was no congestion present, the patient would not be put to sleep under its influence, but would sleep under the influence of opium. If active congestion was present in delirium tremens, the chloral would be a proper remedy to be employed.

The Section then proceeded to the election of officers for the ensuing year.

NEW YORK PATHOLOGICAL SOCIETY.

Stated Meeting, December 12, 1877.

DR. E. G. JANEWAY, PRESIDENT. IN THE CHAIR.

(Continued from page 115.)

CONSERVATIVE SURGERY.

DR. MASON exhibited a male patient, aged about 45 years, for the purpose of illustrating one of the triumphs of conservative surgery.

Thomas Daly, aged 45; Ireland; married; car-driver; admitted to Roosevelt Hospital, March 23, 1877. On day of admission, patient was endeavoring to couple a loosened trace, when the horse bolted suddenly and dragged him over the dash-board of the car on which he was the driver.

An examination revealed compound fractures of both condyles of the left humerus and of the head of left radius; also considerable comminution.

As patient's history and condition were unusually good, an attempt to save the limb was thought justifiable, the external wounds being small.

On March 27th, erysipelas, which became phlegmonous, attacked the injured part and spread rapidly up the arm to the shoulder and over the back. Hypodermics of a solution of carbolic acid employed to arrest the spread of the erysipelas. Temperature of patient, for two weeks, ranged from 104° to 106½°. Patient unconscious the while. Suppuration very ex-

tensive and diffuse. Free counter-openings made for drainage. About April 20th, a large portion of external condyle and trochlear surface was removed with dressings. One week later a piece of the internal condyle and trochlear surface was taken away. Small granular pieces of bone came away from time to time, until April 21st, three days after patient's discharge from hospital.

Recovery of patient was decidedly rapid from May 16th, when he was allowed to sit up for the first time. Passive motion perseveringly employed both by house-surgeon, Dr. Halstead, and the patient. August 18th. discharged cured.

REPORT OF THE MICROSCOPICAL COMMITTEE ON THE CASE OF LARYNGEAL PHTHISIS, PRESENTED ON THE MEETING OF NOVEMBER 14, 1877, BY DR. BEVERLEY ROBINSON.

To external appearance there was no decided lesion of the larynx, more than that the surface of the mucous membrane was rough, especially at the base of the epiglottis, and from this point down to and over the lower vocal cords. There was no decided elevation of the mucous membrane, indicative of miliary tubercular granulations. On section of the tissue between the epiglottis and upper margin of the upper vocal cord a number of yellow, circular spots were noticed in the submucous tissue. They looked to the eye like cheesy nodules, and varied in size from a pin's head to a No. 2 shot. No miliary granulations were seen anywhere. Examined microscopically, it was seen that these spots had undergone granular and fatty change, as is seen in the so-called "yellow granulations." The submucous tissue was in places densely infiltrated with lymphoid corpuscles, chiefly about the mucous glands, but neither adenoid tissue nor giant-cells were seen. The epithelium of the surface showed the characteristic cylindrical form that occurs throughout almost the whole of the larynx, and was intact, except in a few places, but never wholly gone. In these places the epithelium was low, deformed, and did not take the coloring matter. The elongated papillæ seen on the true vocal cords and in the posterior foldings of the mucous membrane, near the arytenoid cartilages, were normal.

Stated Meeting, Dec. 26, 1877.

DR. E. G. JANEWAY, PRESIDENT, IN THE CHAIR.

TUMOR OF OPTIC THALAMUS—NO SYMPTOMS OF BRAIN LESION.

DR. E. C. SEGUIN exhibited a tumor of the thalamus opticus which had been removed from a patient under the care of Dr. Willard Parker Unfortunately there were no symptoms of brain lesion during life, and no history bearing directly upon the nature and extent of the lesion was ascertainable. The patient had merely complained of dyspeptic symptoms, for which he was treated. The point of interest in connection with the supposed absence of symptoms, was the situation of the tumor in the substance of the thalamus, and confined to its anterior portion, the internal capsule not being involved. The optic nerves were not examined.

DR. JANEWAY referred, in this connection, to a case under his care in which two hemorrhages occurred on the same side of the brain. One effusion was just below the position of the tumor in Dr. Seguin's case, involving the internal capsule and lenticular nucleus. The other hemorrhage took place in the first temporo-sphenoidal convolution, involving the descending horn of the lateral ventricle. In that case there was a marked loss of sensation. The patient (a woman) lived two days after the accident.

DR. SEGUIN asked if the second lesion produced any symptoms.

DR. JANEWAY, in answer, alluded to a case of cerebral tumor which occupied precisely the position of the second lesion in the case referred to, and in which there was undoubted paresis on one side.

INTRA-UTERINE FIBROID.

DR. A. C. POST presented an intra-uterine fibroid which he had removed, by operation, from a widow, aged 34 years. Her husband died four years ago. During her married life she had several abortions, and from the time she first menstruated she had been subject to dysmenorrhœa. A uterine tumor was not detected until a few months ago. She had had for a considerable time past paroxysms of rectal and vesical tenesmus, and a moderate amount of uterine hemorrhage. On several occasions she had retention of urine, and it was during one of these attacks that she was examined by her family physician, who detected the nature of the trouble. She then came under the care of Dr. Post, at the Presbyterian Hospital. The os uteri was dilated to the size of a silver dollar, and the extremity of the intra-uterine growth was easily reached. The margin of the cervix was firmly attached to the tumor at its posterior part. The uterine probe showed the length of the tumor to be four and one-half inches. The patient was placed under the influence of ergot (Squibb's fluid ext.) for several weeks, in doses of a drachm three times a day, and afterwards four times a day. It occasioned some uterine contractions, but not of a severe character, and did not affect the position of the tumor. It nauseated the patient somewhat, and the remedy was temporarily suspended accordingly.

December 20th, the patient was etherized, placed in the lithotomy position. Firm pressure was made upon the hypogastrium, the uterus was pushed down so that the tumor could be brought within easy reach. The presenting portion of the tumor was then seized with a vulsellum. and firm traction made upon it. It yielded but little, however, until the firm adhesions at the cervix were severed. The finger could then be passed around the growth. The adhesions to the uterine walls were separated slowly and with difficulty. A strong double ligature was then passed through the growth, and a loop made. By this means a very convenient method of making traction was applied, and almost replaced that made by the vulsellum. The separation of the tissues by means of the finger, and afterwards by Dr. Thomas's serrated spoon, was kept up until the larger part of the uterus was through the os uteri. It was then found that the os itself resisted the further descent of the tumor; the former was then nicked with a scissors, when the mass was extracted without trouble. There was but a moderate amount of blood lost during the operation. After the removal of the tumor the whole hand could be passed readily into the cavity of the uterus, which was exceedingly soft and flaccid. The tumor weighed nearly seventeen ounces.

When the patient was removed to the ward there was considerable hemorrhage, but not of an alarming character. There was some soreness over the anterior portion of the uterus, but the temperature at no time rose above 102°.

RENAL CALCULUS.

DR. AMIDON presented two specimens of renal calculi removed post-mortem from patients in the New

York Hospital, under the care of Drs. Woolsey Johnson and George A. Peters, respectively. The histories are as follows:

Case I.—Male, æt. 31, brass founder. August 21, 1877, admitted to New York Hospital, service of Dr. Woolsey Johnson. Four months ago, weakness in the small of back, and slight pain in same situation was noticed. Two months later attacks of vomiting set in, which lasted till death. About the same time the ankles, then the abdomen, and last the face began to swell. The degree of swelling varied with the treatment. It was at no time excessive. Cough, with copious mucous expectoration, was present. The urine was all through scanty, ℥ x. daily, and contained albumen, hyaline, and granular casts.

Aug. 22d.—Diarrhœa set in. Vomiting continued.

Aug. 24th.—Diarrhœa excessive. Two or three watery stools every hour.

From Aug. 24th to Sept. 5th, no history, except the previous symptoms continued and aggravated.

Sept. 5th.—Died.

Autopsy.—Extreme pallor of the skin. General anasarca. Hypertrophy of the left ventricle. Insufficiency of the pulmonary valves. Considerable bloody serum in both pleural cavities. Extensive œdema of both lungs. More than a quart of clear, amber fluid in the peritoneal cavity. Liver enlarged. Right kidney enlarged, but of normal appearance on section. Left kidney hard to find, and removed on account of its small size and the inflammatory adhesions in the perinephritic areolar tissue which bound it down to the posterior abdominal wall. The adhesions were apparently old. The kidney, when removed, showed an irregular sinus on its posterior surface, from which a puriform fluid could be squeezed. Capsule adherent, cortex thinned; medulla atrophied, papillæ flattened and of grayish-black color. Pelvis contracted, discolored, and full of a purulent fluid. Left ureter hypertrophied, and pervious to a small whalebone guide, but about one and a half inches below the kidney the ureter was dilated and contained a rough calculus one-half an inch in diameter. Bladder was normal. No vesical calculi existed.

Case II.—Male, æt. 57, France. Brass finisher. Married. Admitted Nov. 16th, service of Dr. George A. Peters. Suffering from abscesses in right side of the neck. Patient complained of continuous headache, pain in the neck, small of back, and in the course of ureters. Had attacks of shivering accompanied by spasms of the legs. Had a maximum temperature varying from 101° to 103°. Patient was emaciated, suffered from anorexia, constipation, and hemorrhoids. There was no œdema or ascites. Micturition on admission was difficult, and later almost complete retention of urine came on. Urine was drawn twice a day with a catheter, which met an obstruction far back in the prostatic urethra. The urine at first was clear, but later became cloudy and ammoniacal, contained albumen and casts, and had a sp. gr. of 1010. About twenty-six ounces were daily drawn. Examination of bladder by Dr. Peters showed the absence of stone and the presence of an hypertrophied prostate.

Dec. 23d.—Died.

Autopsy.—Fourteen hours after death. External appearances normal. Head and spinal canal not opened. Contents of chest normal. No peritoneal fluid. Liver, stomach, pancreas, and spleen normal in appearance and position. Right kidney of normal size and position; capsule adherent, cortex injected; medullary portion grayish and atrophied; pelvis dilated, papillæ flattened, and calyces dilated. The right ureter presents several fusiform dilatations in its course the size of an almond. Left kidney displaced upwards. Capsule adherent, cortex thinned and fatty in some places. Medulla black and atrophied, pelvis dilated, and containing a stone the size of an English walnut. The left ureter, just below the stone, was of normal size, but still lower it was dilated to the size of the wrist, and contained within its thinned walls about two pints of a thin, purulent fluid. Before reaching the bladder it again contracted to the size of a lead-pencil. Bladder full of purulent urine. Muscular coat hypertrophied. Mucous coat presents the appearances of chronic cystitis. On the left wall of the bladder is seen a round opening, one and a half inches in diameter, which leads into a spherical sac three inches in diameter. The walls of the sac are thinner than those of the bladder proper. There was no vesical calculus. The prostate was symmetrically hypertrophied to about twice its normal size. Some small prostatic calculi were found.

Dr. L. A. Stimson exhibited a fleshy vegetation one inch in length, and covered with vesical epithelium, which was discharged per urethram by a child nineteen months old. The specimen was sent to him without a history.

The Society then went into Executive Session.

Correspondence.

THE TREATMENT OF DIPHTHERIA.

To the Editor of The Medical Record.

Dear Sir:—In his recent article on "The Treatment of Diphtheria" in the Record of Jan. 12th last, Dr. C. E. Billington gives as the "distinctive features" of his treatment the following: 1. The combinations in which he gives the tincture of the chloride of iron, the chlorate of potash, and the lime-water, mixing them with glycerine. 2. The convenient and unirritating method of their application, meaning, doubtless, the spraying of the throat with carbolic acid and lime-water mixed. 3. The frequency of the application of the remedies. 4. The avoidance of local irritation of the membranes by brushes or swabs. 5 and 6. The omission of quinine or other unpleasant medicines, and of alcoholic stimulants (as a rule).

By neglecting to mention whether other observers have adopted the same or a similar course, Dr. Billington allows us to assume that this plan is original with him. Now, Mr. Editor, it seems no more than justice to correct this impression, since I find essentially precisely the same rules recommended by Dr. A. Jacobi, in an article entitled "Contributions to the Pathology and Therapeutics of Diphtheria," read before the County Med. Soc., Dec. 28, 1874, and published in the *American Journal of Obstetrics* for Feb., 1875. In this article the frequent application of the iron, the chlorate of potash, and the lime-water, mixed with glycerine, is distinctly recommended, although the convenient formulæ of Dr. Billington are not given, probably because every physician knows how to write such prescriptions. Both the iron and the chlorate are positively ordered to be given every quarter hour, half hour, or hour, as may be necessary. Local applications by swabs, etc., are discountenanced as unnecessary, because the medicines, when swallowed sufficiently, touch the diseased pharynx. Carbolic acid and lime-water are also recommended as local

disinfectants, particularly in nasal diphtheria, applied by means of a syringe every half hour or hour. Quinine and other internal antiseptics, according to Dr. Jacobi, are useless.

Of distinction sixth, I do not speak, as probably it is scarcely necessary to caution against the indiscriminate use of stimulants in cases where the patient readily takes all the nourishment he requires; and when the reverse occurs, no physician would hesitate to give all the stimulants he can induce the patient to take. In this particular, there can be but little difference of opinion.

Now, Mr. Editor, where are the "distinctive features" of Dr. Billington's treatment? Apparently solely in the use of the spray instead of the syringe, for I do not find the former instrument mentioned in Dr. Jacobi's paper. Dr. Billington's statistics show the excellence of the treatment; therefore, it is but fair that the man who employed it years previously, and reported it before its adoption by Dr. Billington (in the epidemic of 1875, as the latter states), should receive the credit due him, and not be passed over in silence.

PAUL F. MUNDÉ.

29 WEST 45TH STREET, Feb. 9, 1878.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—I was somewhat surprised when I read Dr. Billington's letter in the current number of THE MEDICAL RECORD, in which he takes me to task for certain *supposed* criticisms of his article on "Treatment of Diphtheria," in the RECORD of January 12th. It is true, as he says, that I did not, at the time, read his article very carefully. I have since done so, and reiterate that I see nothing "strikingly new" in his method of treatment.

He makes chlorate of potash and tincture of the chloride of iron the basis of his constitutional remedies; so do hundreds of others. He uses almost the identical spray mentioned by Dr. J. Lewis Smith, in the October, 1877, number *Am. Journal Med. Sciences*. He claims a distinct method, because, 1st, "the combinations are simple, pleasant, harmless, and efficacious;" 2d, "the convenient and unirritating methods of their application;" 3d, "the frequency of their application;" 4th, "he does not, as a rule, apply a brush or swab to the throat;" 5th, "he does not, as a rule, give quinine or other unpleasant medicines to children;" 6th, nor, "as a rule, alcoholic stimulants."

I contend that other combinations of chlorate of potash and tincture of iron, which are used by others, are equally as "simple, pleasant, harmless, and efficacious;" 2d, supposing that the doctor refers to local treatment, I affirm that there is nothing "*new*" in his suggestion of the spraying apparatus; 3d, he will find that Smith and others used their remedies about as frequently as he does; 4th, Oertel, for one, has anticipated Dr. B. in condemning all harsh local applications to the throat; 5th, it is almost universally acknowledged that all medicines, the administration of which necessitate a struggle with the child, or which produce nausea or vomiting, should be omitted in the treatment of diphtheria. The reason is obvious. I will not discuss it. But I contend that quinine can be given in mucilage of slippery elm, without resistance from the patient, and without subsequent nausea and vomiting. Scarcely any one denies the great value of this drug in diphtheria. If the doctor objects to quinine on the ground of its unpleasantness, his objection must be overruled. 6th (and here is one great difference), he objects to the use of stimulants, except in rare instances. I do not believe in the indiscriminate use of stimulants in diphtheria; neither do I in any disease. Accepting Dr. B. W. Richardson's views of the physiological action of alcohol as correct, I employ it only to tide over impending danger from paralysis of the heart. In mild cases of diphtheria, and in those severe because of laryngeal complication alone, I do not use stimulants. In those cases where there is marked systemic infection (especially if there is a tendency to asthenia) I prescribe them freely.

The principal points of difference in Dr. B.'s article and that of Smith, *loc. cit.*, are these: Dr. B. regards diphtheria as primarily a local disease; Dr. S. does not. With this difference I have nothing to do, as it was the similarity of treatment alone which I discussed; second, the use of quinine; third, the employment of stimulants. In all other important points of medicinal treatment their methods are very similar. I need only to refer to their respective articles for proof of my assertion. Dr. B. thinks it strange that I should have associated the two methods; I do not. Finally, I have never assumed that Dr. Billington's treatment possessed no *just* "*claim to originality.*" I said that it was not "*strikingly new.*" Stephenson "originated" the locomotive, Morse the telegraph; some person may possibly "originate" them again with "*slight modifications*," but they would not be "*strikingly new.*"

W. B. RODMAN, M.D.

FRANKFORT, KY., Feb. 5, 1878.

THE DEATH FROM VACCINATION.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—A few weeks since I reported a case of death following—NOT *dependent upon*—but following vaccination. The object in reporting the case was to explain the probable cause of death and prevent it from appearing hereafter as a death due to syphilis, erysipelas, or other bugbear urged by the enemies of vaccination. In that report I tried to make three plain statements: 1st, that reports of death following vaccination were very rare; 2d, that certain diseases sometimes could be communicated by impure virus, which, however, I showed could not have been the cause in the case reported; 3d, that my patient doubtless did die of septicæmia.

A medical gentleman, for whom I have the highest respect, and whose appreciation of the value of vaccination can be superior to mine only as his knowledge of the subject is superior to most general practitioners, seems to have read the report so carelessly as to have considered it allied to the notorious Westford cases, and, in his zeal to defend bovine virus from a supposed attack, attributed the death to vaccination during the prevalence of scarlatina, and attached some censure to the operation at such a time.

In explanation of the cases of scarlatina appearing at that time, it is proper to state that all occurred in one house in the extreme suburbs, nearly a mile from my office, and that my patient was not, at any time, nearer than one mile to that house. Further, the cases of scarlatina were not patients of mine, nor had I seen a case of scarlatina for more than two months previous.

Should censure properly be attached to vaccination during the prevalence of scarlatina, in all our large cities vaccination would be permanently suspended, since at no time are most large cities free from the prevalence of scarlatina.

As I expressed in my first communication, and as Dr. Martin could have observed had he read more care-

fully, the death was evidently due to septicæmia, not to scarlatina; and as well might have followed the removal of the epidermis by the scalpel had no vaccine virus been introduced into the system—as well might have followed the bite of a mosquito, a bullet-wound, or pin-scratch.

I have recalled the attention of the profession to this case, lest it should be distorted and compelled to do service by the enemies of vaccination.

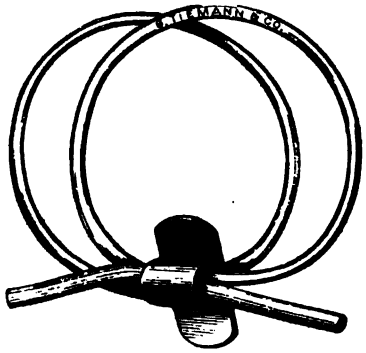
JESSE HAWES, M.D.

GREELEY, COLO.

ESMARCH'S BANDAGE.

TO THE EDITOR OF THE MEDICAL RECORD.

IN Esmarch's prize essay on Military Surgery, recently published, I found a woodcut of a simple contrivance for fastening the rubber bands or tubing used in his "bloodless method," which has proved so useful in the New York and Roosevelt Hospitals, that I venture to ask you to republish the diagram, in order that it may be more widely known. When the tubing is drawn tight in encircling a limb, it narrows so much that it can be introduced through the slit seen on the top of the instrument, but when the tension is relaxed, the natural increase of the diameter of the rubber beyond the clamp prevents all slipping or yielding. To unloose it, the rubber band is again pulled upon until it is thinned sufficiently to escape through the slit.



A little smaller size is needed for a rubber band than for rubber tubing.

Yours, truly,

R. F. WEIR.

I may add that Langenbeck has also devised a catch like an ovarian clamp (which will answer as well), to secure the extra turns of the rubber *bandage* when this plan is resorted to, to avoid the more concentrated pressure of a band or tubing upon the tissue.

THE PROVIDENT DISPENSARY SYSTEM.

TO THE EDITOR OF THE MEDICAL RECORD.

DEAR SIR:—A large number of the profession in this city felt aggrieved at the action taken by the New York Hospital in issuing a circular offering to treat "all persons without distinction" for the sum of one dollar per month, and now comes the "Good Samaritan Hospital," where, "to avoid the abuse of this charity," persons having an income of twenty dollars per week are required to pay *twenty cents per week* while under treatment, and "the staff is to be increased from time to time as the requirements of the institution may demand." Now let me ask, if this plan is to be extended and made popular, where are the majority of New York physicians to look for their patients? At the present time, I believe, much the larger part of the heads of families in this city would be glad to receive an income of twenty dollars per week, and the larger part of New York practitioners have derived a modest livelihood from fees of one or two dollars, cheerfully paid by the middle classes. Why is our right to be ignored by inducements held out to "the industrial classes" to obtain "the best medical and surgical treatment" for twenty cents per week, or for one dollar per month, as the case may be?

These professors, who breathe the atmosphere of Fifth Avenue, and who despise anything less than a fee of from ten to twenty-five dollars, seem to quite ignore the rest of the profession. Do they alone possess the *fundamental* knowledge requisite to treat diseases of the rectum? Their names upon our diplomas would seem to contradict that assumption. They took our fees as students, and have received many a fee since in consultations which we have procured them, but if they seek now to leave us no field in which to practise, we shall be compelled in return to ignore them and all specialists, and in self-defence to consult only ourselves, and to return to the old plan of every physician covering the whole field of practice. R.

NEW YORK, January 22, 1878.

PROPRIETARY MEDICINES.

TO THE EDITOR OF THE MEDICAL RECORD.

ALLOW me to correct and apologize for a blunder of mine at the late meeting of the State Medical Society, to which Dr. George Bayles has called public attention through your columns (current series, p. 120). In referring to an action which the Society had taken in regard to advertising patented articles through its Transactions, a paper was mentioned without giving its title or its author, and the wrong patent medicine was named. This I regret and apologize for.

Dr. Bayles was the author of the paper referred to, and his paper was rejected by the Society because it recommended a patent medicine, and the blunder was that I named another patent medicine of the same house that he was then advertising instead of the one he recommended. Dr. Bayles has, therefore, correctly suspected that his was the paper referred to. Had he been equally acute in seeing the true character of the blunder he would have been saved the trouble of the very emphatic denial and imputation with which he has publicly favored me.

It was this same old subject before the State Society, and the action taken upon it, which you criticise in an editorial on pages 71 and 72 of your current series. If you will in that article read mineral-waters or wines instead of patented goods, and refer back to criticisms which you have made upon medical men aiding to advertise such articles, it is probable that the recent action will not appear as "pandering to" either "prejudice" or "reason."

One of the grounds for objecting to the name of the Patent Food Company being given has escaped your notice, and that was that at least two other companies have similar foods, professedly prepared in a similar manner, from similar material, by patented processes, and that the State Society's Transactions would be likely to be quoted in advertising one company to the prejudice of others, without adequate knowledge of the relative values of the products. It was, therefore, thought to be sufficient that the food should be described without giving the name of any particular company, and the wonder was that the author of the paper did not consent to withdraw the name without

pushing the matter to a discussion and a vote, which obliged him to withdraw it or his paper. The food being fully described in the terms of nearly all the advertisements of all the companies, it would have been left to the professional reader to judge as to which company's drummers and advertisements should be accepted.

The high stand which the RECORD has taken in regard to these matters, and notably the editorial on p. 93, commending the excellent resolutions adopted by the New York County Society, on p. 99, make the criticisms above referred to seem a little inharmonious, for, if we put the State Society in the place of an individual member of the profession, how can it consistently lend its publications "for the purpose of advancing the pecuniary interests of any inventor, patentee, originator, discoverer, manufacturer, proprietor, or advertiser"—no matter whether the article be mineral-water, wine, or food?

Very respectfully yours,

E. R. SQUIBB.

BROOKLYN, February 11, 1878.

[We are much obliged to Dr. Squibb for calling our attention to apparent inconsistencies in our remarks upon so-called "patented foods." He is certainly in error when he supposes that our criticisms upon this subject had any reference whatever to a previous action of the Society regarding the use of patent medicines, or of any patented articles for the exclusive use of the sick. On the contrary, we referred to the "food" as an entirely independent matter. We also stated at the time, that the "food" was patented only as to its method of manufacture; that its composition was no secret; that it was not a medicine, but a mere article of alimentation, and as such it did not come under the provisions of the code. Patented medicines and patented articles of ordinary commerce, are not convertible terms, as regards prohibition of their use according to the code. As far as any attempt at advertising the food was concerned, or of committing the Society upon its merits, we believe the author of the paper was above suspicion. The mere allusion to an article does not imply an attempt to advertise it. We understood him to recommend it, and incidentally to mention the name of the company merely because it was necessary to designate a particular article. But Dr. Squibb now states the fact, of which we were ignorant before, that such a precaution was not necessary, as at least two other companies manufactured virtually the same article. This, it strikes us, is the best reason why the name of a particular company should be omitted, and the best of excuses for the action of the Society. In any event, no company has a right to use for purposes of advertisement any recommendation thus made, without the permission of the author or of the Society.

There is nothing in all this inconsistent with an unqualified endorsement of the recent resolutions of the County Society. A medical man may recommend an article to his professional brethren, because he knows it is good, and be perfectly indifferent as to the pecuniary interest of the proprietor. Everything depends upon the man who gives the recommendation or the certificate. The code is hardly competent to make any restriction upon such a practise, provided it is limited to professional channels, and for the ostensible purpose of advancing professional knowledge. Under such circumstances we have never objected to the publication of any *bona fide* certificates for mineral waters, wines, or other similar articles. Of course, it would be improper for the Society to lend its publications for the mere purpose of advertising the company in question, but we are scarcely willing to admit that the paper was presented for such a purpose. When these certificates or recommendations are published in the daily papers, the case is entirely different, as we have on previous occasions endeavored to prove.—ED.]

Feb. 9, 1878....	0	11	80	6	99	73	0

THE LATE DR. E. R. PEASLEE.—The following were adopted at a recent meeting of the Faculty of Bellevue Hospital Medical College:

Whereas, In the wisdom of the merciful Father of all, it has seemed good to suddenly take from our midst our honored associate and co-worker, Prof. Edmund Randolph Peaslee; and whereas we, the Faculty of the Bellevue Hospital Medical College, desire to express our respect, esteem, and affection for his memory; therefore

Resolved, That we have received the intelligence of his death with heartfelt sorrow, and a deep sense of the greatness of our loss.

Resolved, That in future it will be our delight to recall the singular purity of a life in the presence of which the voice of envy was silent—a life nobly spent, unstained by meanness and falsehood, but beautiful in its private worth, and in its devotion to the highest aims of the profession in which he stood pre-eminent.

Resolved, That in his lifetime the wide-spread confidence he enjoyed and the many honors conferred upon him, were only the just rewards of his high attainments as a scholar, and his many and important contributions to science. His crowning work upon ovarian tumors stands almost without a rival in medical literature, in the high attributes of taste, judgment, and independent thought, and it behooves us, now that his record is finished, to proclaim, what he, with the modesty of greatness, left unspoken, his own distinguished part in placing upon a firm foundation the operation for the removal of ovarian growths, which is justly regarded as the foremost achievement of modern surgery.

Resolved, That in warm sympathy with his family, we direct that these resolutions be forwarded to them as a slight, though inadequate expression of our regard for our deceased comrade.

(Signed) FORDYCE BARKER, M.D.,
ISAAC E. TAYLOR, M.D.,
WILLIAM T. LUSK, M.D.,
Committee.

The following resolutions were adopted by the students of Bellevue Hospital Medical College, New York, Jan. 26, 1878.

Whereas, We, the students of Bellevue Hospital Medical College, have learned with feelings of the most profound sorrow and regret, of the death of Professor Edmund R. Peaslee, whom we all so greatly admired for his superior qualities as a teacher, his virtues as a man, and his constant devotion to the interests of science and our profession; therefore, be it

Resolved, That in his death our school has lost an earnest and justly noted teacher; our chosen profession a faithful and untiring worker for its honor and advancement, and society at large an honorable and useful citizen.

That, while we deeply deplore our loss, yet we meekly bow in submission to the inscrutable will of a wise Providence who doeth all things well; and shall ever commend to others, and strive to imitate in our own lives, those estimable traits of character which rendered him so eminent and worthy of our emulation.

That we extend to the family of our lamented friend and teacher our heartfelt sympathy in this their sad bereavement.

Be it further Resolved, That a copy of these resolutions be given to the family of the deceased, to the secretary of our Faculty, and to the medical journals for publication.

CHARLES H. EAMES,
D. SCOFIELD,
OSCAR A. KING,
R. G. EBERT,
FREDERIC HERBERT LAY,
Committee.

The following resolutions were adopted by the staff of the Woman's Hospital:

Whereas, It has pleased the Almighty in his infinite wisdom to remove from our midst our esteemed associate and fellow-laborer, Dr. Edmund R. Peaslee; therefore, be it

Resolved, That by his loss the medical profession of this city has been deprived of one of its ablest and wisest members; one who during his whole career has discharged all his functions with an unflinching devotion to duty, and won the respect and esteem of all who knew him.

Resolved, That in the death of Dr. Peaslee the Woman's Hospital in the State of New York has lost one who, by his devotion to its interests and untiring exercise of skill in its service, has contributed greatly to its efficiency and usefulness; and that its Medical Board has been deprived of a member whose judicious counsels, honesty of purpose, and amiability of disposition had peculiarly endeared him to his associates.

Resolved, That we tender our deepest sympathy to the bereaved family in their affliction; that these resolutions be published in the medical journals of this city, and that a copy of the same be sent to the family.

T. GAILLARD THOMAS,
T. A. EMMET,
Committee.

The following was communicated by the New York Obstetrical Society:

"The New York Obstetrical Society desires to give expression to the incomparable loss which it has suffered in the death of Dr. E. R. Peaslee, one of its founders and most distinguished members.

"We feel that he has, perhaps more than any one of its fellows, contributed to the elevated standard which the Society has acquired among its sister associations.

"The roll-call of the meetings will prove his most constant and continuous attendance, its record that he has brought to its consideration rich funds of material from the fields of his wide and carefully studied experience.

"To the value of its discussions he has contributed eminently by his always luminous and logical statements, while his just and amiable temper promoted the harmony of its deliberations. The social element of the Society has been equally expanded by his store of wit and humor.

E. NOEGGERATH, M.D.,
JOHN BYRNE, M.D.,
W. M. CHAMBERLAIN, M.D.,
A. J. C. SKENE, M.D.,
Committee."

LIBERALISM IN HOMŒOPATHY.—At a meeting of the Society held on the 8th of February, the following preambles and resolution, reported by Drs. Minor, Lilienthal, Dowling, McMurray, and Burdick, were adopted:

Whereas, There are some physicians who by injudicious action have bred dissension in our ranks, in which the utmost liberty of opinion and action should always prevail; and,

Whereas, We deprecate such action as neither conducive to professional harmony, nor tending to the advancement of medical science; therefore,

Resolved, That in common with other existing associations which have for their object investigations and other labors which may contribute to the promotion of medical science, we hereby declare that although firmly believing the principle "*Similia Similibus Curantur*" to constitute the best general guide in the selection of remedies, and fully intending to carry out this principle to the best of our ability, this belief does not debar us from recognizing and making use of the results of any experience, and we shall exercise and defend the inviolable right of every educated physician to make practical use of any established principle in medical science, or of any therapeutical facts founded on experiments and verified by experience, so far as in his individual judgment they shall tend to promote the welfare of those under his professional care.

ARTHUR T. HILLS, M.D., *Sec'y.*

THE NEW MATERNITY HOSPITAL.—The following gentlemen have been appointed *Obstetrical Surgeons* to the new Maternity Hospital, Blackwell's Island: Consulting, Isaac E. Taylor, M.D., Fordyce Barker, M.D.; Attending, T. G. Thomas, M.D., W. R. Gillette, M.D., W. T. Lusk, M.D., M. A. Pallen, M.D.

DEATH OF WILLIAM STOKES, M.D., F.R.S., D.C.L., OF DUBLIN.—This distinguished physician died in Dublin, January 7, 1878, in the seventy-sixth year of his age. He studied medicine in Edinburgh, Scotland, and took his diploma in 1825. Three years after he married and settled into practice, and at the same time he published his first work on the "Application of the Stethoscope to the Diagnosis of Thoracic Disease." This brought him into immediate recognition, and he soon commanded a large and lucrative practice. In 1837, he published his work on "Diseases of the Chest," and two years after received the honorary degree of M.D. from Trinity College, Dublin. In 1845 he was chosen Regius Professor of Physic to the University. In 1849, he produced the greatest and most important of all his works, "The Diseases of the Heart and Aorta." Oxford gave him the hon. D.C.L. in 1865, and Cambridge its hon. LL.D. in 1874. Edinburgh also followed with her LL.D.

IMPORTANT TO PHYSICIANS.

Physicians practising in the Southern and Western States, are usually careful in designating (WARNER & Co.,) when writing prescriptions for Pills, as they have derived the most beneficial and uniform results from the use of these preparations. It would be well for physicians everywhere, to exercise this same caution when prescribing pills, of Quinia and Phosphorus, as well as other kinds.

Twenty years experience has demonstrated that the covering of pills with sugar, affords the acme of perfection, when the coating is properly applied, and for this reason, WARNER & Co's, are superior to all other sugar-coated pills in the market. They possess advantages in every respect, over those coated with gelatine. Sugar is more soluble than gelatine and when necessary, is applied to pills, so soft as not to retain their form uncoated.

They are beautiful in appearance, more acceptable to the patient, more readily swallowed than the oval or pointed shaped pills, with their sticky coating.

Doctors who had formed a prejudice which caused them to favor gelatine-coated pills, on account of their much vaunted merit for solubility, write us, that their delicate patients revolt at their ugly color and shape. Physicians throughout the country have it in their power to disprove their claim for greater solubility, as samples of gelatine-coated pills, in small paper boxes, have been extensively distributed within a comparatively recent date.

After being kept for a time, they become hard and brittle. The enclosed mass, as well as the gelatine coating, losing all its moisture. This proves that gelatine is not non-pervious, and is certainly not the proper material with which to protect medicinal substances, especially Phosphorus in pilular form.

The original manufacturer of gelatine-coated pills, conveys the information that two coats of shellac varnish were applied before the covering.

Prof. Remington, of the Philadelphia College of Pharmacy, demonstrated long ago, by practical experiments, that sugar-coated pills are more soluble than those gelatine-coated.

ALWAYS SPECIFY "K. & M." GRANULATED EFFERVESCENT SALTS.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen.—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KEEN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case.....$9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*

Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York**, will receive prompt attention.

Dr. Garratt's Constant Electric Disks,

That any person may apply and wear with comfort for relief of local *pains* and *weakness*; for old Rheumatic and Neuralgic pains, coldness and stiffness. It is also remarkable for its constant power to help Weak Lungs, Heart, Stomach, Kidneys, Sluggish Liver, Lame Back, and other ills.

While worn, by night or day, this flexible pad is self-charging and applies a fine, constant galvanism that wonderfully cures nervous ills. For the price and purpose, it has no equal. So say physicians, druggists, and those now using this improved electric. Large Disk, $2.50; Children's Disk, $1.00; Long Disk, with straps for the body, $3.50; Do. for large body, $5. Can be sent by mail on receipt of price, by GARRATT & Co., 6 Hamilton Place, Boston, Mass.

SUNNYSIDE.

A PRIVATE MEDICAL HOME FOR NERVOUS INVALIDS.

Washington Heights, New York.

This Home, unsurpassed for its beauty of location and surroundings, and with handsomely furnished apartments, receives a limited number of cases of either sex, of *Mental* and *Nervous Diseases*, *Dipsomania* and *Opium Habit*, and offers to such patients all the attentions, comforts and attractiveness of a home, together with medical treatment. Applications may be made either by mail or personally at 152d St., bet. 10th Ave. and Boulevard.

Twelve trains daily from Hudson River Depot, 30th St. and 10th Avenue. DR. EDWARD C. MANN, M.D., late Medical Superintendent N. Y. State Emigrant Insane Asylum. DR. WM. H. B. POST.

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops,** viz.: Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT,	**With**		**Hops (Plain),**	**$1 00**
"	"	"	**Pyrophosphate of Iron (Ferrated),**	**1 00**

TO THE MEDICAL PROFESSION.

MALTINE.

(EXTRACT OF MALTED BARLEY, WHEAT AND OATS.)

THIS PREPARATION CONTAINS FROM THREE TO FIVE TIMES THE MEDICINAL AND NUTRITIVE ELEMENTS FOUND IN EXTRACT OF MALT.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat* and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST: In the manufacture of ***MALTINE*** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates and Albuminoids on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity possessing little virtue aside from the saccharine matter which it contains.

SECOND: Carbon, Hydrogen, Nitrogen, Phosphorus, Sulphur, Iron, Magnesium and *Potassium* are essential elements in the food of man; and it is only in ***MALTINE***, containing the combined properties of malted *Barley*, *Wheat* and *Oats* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD: Gluten is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. ***MALTINE*** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH: The bony structure and muscular development of man cannot long be sustained without the Phosphates and nitrogenous alimentary elements, of which ***MALTINE*** contains all of three times the proportion found in any Extract of Malt made from Barley alone—when perfectly made, but when a too high degree of heat has been employed, these principles are almost wholly destroyed.

We believe that any practitioner will readily recognize the superiority of ***MALTINE****, and would request a trial and comparison of merits with any article offered for similar uses.*

MALTINE AND ITS COMPOUNDS

Can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, Imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULAS AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**
This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOSPHATES IRON AND QUINIA:**
A powerful general and nutritive tonic.

***MALTINE* WITH PHOS. IRON, QUINIA AND STRYCHNIA:**
A powerful nutritive, general and nervous tonic.

***MALTINE* WITH HYPOPHOSPHITES:**
This preparation is specially indicated in Phthisis, Rickets and deficient Ossification.

***MALTINE* WITH PEPSIN AND PANCREATINE:**
One of the most effective combinations in Dyspepsia, Cholera Infantum and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the ***MALTINE***. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**
One of the most valuable combinations in cases of general Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH COD LIVER OIL:**
The most perfect emulsion, and most agreeable and effective mode of administering this nauseous but valuable Oil yet discovered.

***MALTINE* WITH COD LIVER OIL AND PHOSPHORUS:**
In this combination the Phosphorus has no irritant effect upon the stomach.

***MALTINE* WITH COD LIVER OIL AND IODIDE OF IRON:**
This is prepared with the tasteless Iodide of Iron, which undergoes no chemical change from contact with the Oil, and does not blacken the teeth.

***MALTINE* WITH ALTERATIVES:**
In this preparation ***MALTINE*** is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.
Each fluid ounce contains: *Chloride Calcium*, 10 grains; *Chloride Magnesium*, 10 grains; *Bromide Sodium*, 5 grains; *Iodide Potassium*, 1 grain; *Iodide Iron*, ½ grain. DOSE, One teaspoonful to one tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only*.

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in amber bottles holding sixteen fluid ounces; each bottle inclosed in a folding paper box.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of **CASWELL, HAZARD & CO., New York,** and of all respectable Chemists throughout the world.

JOHN REYNDERS & CO.,

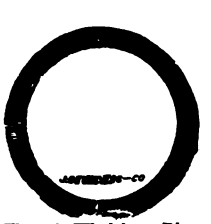
(Late of OTTO & REYNDERS),

No. 309 Fourth Avenue, New York,

MANUFACTURERS AND IMPORTERS OF

Surgical and Orthopædical Instruments,

Skeletons & Anatomical Preparations.



The only Whalebone Ring Pessary as used and recommended by *Dr. E. R. Peaslee.* Price 50 cts.

Dr. Page's Cotton Dumb-Bell Pessaries, 35 cts.; Rubber Covered, 75 cts.: All Rubber, Dr. Trask's Mod., $1.50.

In corresponding with Advertisers please mention **The Medical Record.**

Western Electric Manufacturing Co.

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,

GALVANIC BATTERIES,

BATH APPARATUS, &c.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8¾ x 7¼ x 4¼. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

WESTERN ELECTRIC MANUFACTURING CO.

20 New Church St., NEW YORK. 220 to 232 Kinzie St., CHICAGO.

FOUGERA'S COMPOUND IODINIZED

COD LIVER OIL

Since the introduction of this oil in 1858 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each. DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

E. FOUGERA, Pharmacist,
372 7th Street, Brooklyn, L. I.
SOLE PROPRIETOR AND MANUFACTURER OF THE ABOVE
To whom all special communications should be addressed.

Medical Pictures and Portraits
For PHYSICIANS' OFFICES.

Harvey Demonstrating the Circulation of the Blood
A fine photograph, from a valuable engraving.

Size, 7x9 inches, on fine white mount, 13x16. Price, $1.50
Size, 15x18 " " " 22x28, " 4.00
The engraving of the above is entirely out of print.

THE ANATOMICAL LECTURE.
(After Rembrandt.)

A fine photograph, in both size and price same as Harvey, making a fine companion picture.

THE ANATOMIST.
From a painting by the great artist Max of Germany.

It represents a Professor in deep study, sitting by the side of a female subject of great beauty.

A Fine Etching. Price, $1.00
Or, Proof Copies. " 1.25

JENNER VACCINATING A CHILD
Photograph.

Size, 8½x10 inches, on fine white mount . Price, $1.50.

AMBROISE PARÉ.
To this celebrated French surgeon is attributed the introduction or first use of Ligatures, instead of the old mode by the actual cautery. It represents an operation on the leg of a soldier on the battle-field, surrounded by several eminent men who are looking on with great interest. This engraving, now very scarce and rarely found, has been published in fine Photograph, in three sizes, viz.:

7x9 inches, on white mount, 15x16. Price, $1.50
15x18 " " " 22x28. " 4.00
7x13 " on granite " 11x19. " 2.00

HIPPOCRATES.
A fine photograph from an old and valuable engraving.

Size, 11x14 inches. Price, $1.00.

PHOTOGRAPH PORTRAITS OF
(Imperial Size)

SIR ASTLEY COOPER,
DR. JOHN HUNTER,
DR. RICHARD BRIGHT. } Price, 50 cents each.

THE LUNATIC ASYLUM.
This remarkable picture by KAULBACH, represents a scene in the yard of a Mad-House. A group of unfortunates, each one occupied with the ideas of his own fancy. One as a king, another as a miser, and so on. As a composition and study, it is one of great interest.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

ANDRÈ VESALE.
A picture of this celebrated anatomist, at work in his attic, listening to approaching footsteps.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

Prof. CHAS. A. BUDD.
A photograph from life of the late Prof. C. A. Budd, and the only portrait approved of by himself and family. A fine likeness.

Imperial size, from life. Price, 50 cents.

OTHER PHOTOGRAPHS ARE IN PREPARATION.

Sent by mail, post-paid, on receipt of price.

WM. WOOD & CO., 27 Great Jones Street, New York.

SCHOOL
OF
PRACTICAL HISTOLOGY
No. 446 Fourth Avenue,
NEW YORK CITY.

This school will remain open for Practitioners and Students until July 1, 1878. It will then be closed for three months, to re-open October 1, 1878.

1.—GENERAL NORMAL HISTOLOGY. By Drs. THOMAS E. SATTERTHWAITE and J. A. MCCREERY.

2.—GENERAL PATHOLOGICAL HISTOLOGY. By Drs. THOMAS E. SATTERTHWAITE and JOHN A. MCCREERY.

3.—NORMAL AND PATHOLOGICAL HISTOLOGY OF THE NERVOUS SYSTEM. By Dr. E. C. SEGUIN.

Special instruction will be given in the Minute Anatomy of the Eye and Ear by Dr. C. S. BULL, and in Skin Diseases by Dr. A. R. ROBINSON.

New classes will be formed March 1.

MANHATTAN EYE AND EAR HOSPITAL,
233 East 34th Street, New York.

A Daily Clinic is held at this Hospital for diseases of the Eye, Ear, and Throat, at 2 o'clock P.M. Nervous diseases are also treated at 4 o'clock P.M., on Mondays, Wednesdays, and Fridays. These Clinics are free to the Profession and Students of Medicine.

SCHEME OF ATTENDANCE.

Monday, Wednesday, and Friday:—Drs. Agnew, Pomeroy, Smith, Seguin, Webster, Carey, Chamberlain, and Tansley.
Tuesday, Thursday, and Saturday:—Drs. Roosa, Pardee, Robinson, Ambrose, and Ely.

A course of Private Instruction in the use of the Ophthalmoscope and Otoscope, Errors of Refraction and Accommodation, Selection of Spectacles, etc., is carried on by Drs. Pomeroy, Webster, and Ely. Fee for this course of six weeks, $20.

Drs. Smith and Robinson will give a course in Laryngoscopy and Rhinoscopy to those who desire it.

For further particulars apply to Drs. Pomeroy, Smith, Robinson, Webster, or Ely, at the Hospital.

NOW READY. No. I.

ANNOUNCEMENT.
To be published in Monthly Parts, at a Subscription Price of $5.00 per Year.

STUDIES IN PATHOLOGICAL ANATOMY.
By FRANCIS DELAFIELD, M.D.,

Adjunct Professor of Pathology and Practice of Medicine in the College of Physicians and Surgeons; Visiting Physician and Pathologist of the Roosevelt Hospital; Visiting Physician and Curator of Bellevue Hospital.

IN ROYAL OCTAVO PARTS,

Each containing from 2 to 4 full-page Lithographic Plates in tint, and in color, with accompanying explanatory text. (☞ These studies will form, when completed, a treatise on Pathological Anatomy of exceptional value, especially for the remarkable fidelity of the illustrations, their minute and elaborate detail.) The Parts will be published regularly, the first of each month, and sent to subscribers carefully rolled to protect the Plates from injury.

Subscription Price, $5 a year, invariably in advance.

Single Parts, 50 cents each. Part I. will be published Feb. 1st.

☞ *Specimen copies will be sent on receipt of 50 cents.*

Address the Publishers, **WM. WOOD & CO.,**

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine. Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

LAZELL, MARSH & GARDINER'S POWDERED MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts*.

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz.		per oz.
Powd. Ext. Aconite Leaf	.40	Powd. Ext. Jalap	.40

FOOD IS THE BEST TONIC!!

MENSMAN'S

PEPTONIZED

BEEF TONIC.

TRADE MARK.

The great necessity for a fluid food that would possess **all the elements necessary for the support of the system**, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared after a thoroughly tested and scientific method.

PROPRIETORS,

CASWELL, HAZARD & CO.,

DRUGGISTS AND CHEMISTS,

NOTICE.—See our Advertisement, page 13.

Extract of Malt

WITH

COD LIVER OIL.

Our Improved Extract of Malt with 50 per cent. of our fine Norwegian Oil, is pre-eminently THE emulsion of Cod Liver Oil, since it *has double the nutritive effect of any other emulsion of oil.* It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that IT UNITES PERFECTLY WITH WATER IN ANY PROPORTION, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

DOSE.—A Dessert to Tablespoonful immediately after Meals.

Prepared with the most scrupulous care

" Taraxaci, in 1 lb. porcel. jars,						80c.
" Ferri Pomate, " " " "						$1 00

Prices inclusive of jars and bottles.

MATHIAS ROZSNYAY,

Arad, Hungary,

Begs leave to inform the Medical Profession that he has given his sole agency and the exclusive control of his preparation of

TASTELESS QUININE,

Neutral Tannate of Quinine,

To Mr. F. ALFRED REICHARDT, who keeps full stock of his preparations.

The discovery of Mr. Math. Rozsnyay to make an *absolutely tasteless and reliable* preparation of Quinine is one of the most important in modern therapeutics. The ordinary Tannate of Quinine, as made in chemical works, is obtained by precipitating the mother liquor, of which Quin. Sulphate has crystallized out, by an addition of Tannic Acid. First, this is an acid or bi-tannate, and contains likewise all the other Cinchorn Alkaloids. Quinidia, Cinchonidia, Cinchona, Quiniodin, etc., the little intrinsic value of which is best proven by the price lists of large German manufacturers who quote this salt at only one-sixth of the value of the Sulphate. The *neutral* Tannate of Quinia has also great advantages over the Sulphate, as it does not cause the same cerebral and digestive troubles, as has been fully proved by the report of the commission appointed by the Academié de Medicine, in Paris, on a memoir presented by Mr. Bonesiere. The commission consists of Messrs. Orfila, Bussy & Bouvier; their names are sufficient proof for the thoroughness of their researches.

I guarantee that this Neutral Tannate contains in 2½ grains the same percentage of pure Quinine as is contained in 1 grain of the Sulphate, and that its effects in equivalent doses are the same as that of the Sulphate. In treatment of diseases of children and persons of delicate taste, it is of the highest value. It is also put up in Chocolate Lozenges, containing each 2½ grs. of Tannate, 2 doz. in a box. Pamphlet sent free on application. Price per box, $1.00. Per ounce, $3.00.

FRANCIS J. GEIS,

Brewer and Maltster, Dobbs' Ferry, N. Y.,

PURE EXTRACT OF MALT.

Sole Agent for the U. S. and Canada, F. ALFRED REICHARDT.

This extract is absolutely pure and superior to **any other** make, foreign or domestic. Made without addition of hops, glucon, and guaranteed to be free from any substance whatsoever foreign to the best barley malt and distilled water. It is also the *cheapest* in the market. Put up in neat 1 lb. jars at 50c. per jar, or $3.75 per gallon, jar inclusive.

F. ALFRED REICHARDT,

Late Helmick, and Helmick & Co.,

Fluid Extract of Damiana.

The most effective preparation made under this name. It is a very efficient uterine tonic of the highest value in Impotency, Prostatitis, Spermatorrhœa, Suppressed Menses, and Catarrh of the Bladder. Its tonic action is as certain as that of Quinine. Put up in bottles of 6 oz. $2.00 per bottle. $16.00 per doz. Pamphlet sent gratis on application.

NITRITE OF AMYL PEARLS.

Made from Dr. E. Squibbs' Nitrite of Amyl. The only ones in the market of correct dosage. 2 and 3 drop, 75c. per doz. 5, 8 and 10 drop, $1.00 per doz.

IODOFORM, CRAYON'S.

Dr. Leblond's formula for Ulcerations of the Cervix. $1.00 per doz.

APIOL CAPSULES,

GEO. P. ROWELL & CO. conduct an agency for the reception of advertisements for American newspapers. The most complete establishment of the kind in the world.

8,000 NEWSPAPERS

are kept regularly on file open to the inspection of customers. Every advertisement is taken at the home price of the paper, without any additional charge or commission. An advertiser in dealing with the Agency, is saved trouble and correspondence, making one contract instead of a dozen, a hundred or a thousand.

A BOOK OF 120 PAGES

containing lists of best papers, largest circulations, religious, agricultural, class, political, daily and country papers, and all publications which are specially valuable to advertisers, with some information about prices is

SENT FREE

to any address on application. Persons at a distance wishing to make contracts for advertising in any town, city, county, state or territory of the United States, or any portion of the Dominion of Canada, may send a concise statement of what they want, together with a copy of the ADVERTISEMENT they desire inserted, and will recieve information by return mail which will enable them to decide whether to increase or reduce the order. For such information there is no charge. Orders are taken for a single paper as well as for a List; for a single dollar as readily as for a larger sum. Office—10 Spruce Street, New York.

MICROSCOPES.

QUEEN'S STUDENTS',

R. & J. Beck's London Microscopes,

SENT BY MAIL, POST-PAID, ON RECEIPT OF PRICE.

TO PHYSICIANS.
THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving results of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.

The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the ***Medical Department of the United States Army.***

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is generally preferred; or of an **elixir**, when a slight stimulant is desired.

Durel's Syrup of Tar and Iron.

Prepared by DUREL, Pharmacist, Paris.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron, is a desideratum which has at last been attained in this preparation. The indications for such a remedy are many, but it has been found especially useful in ***Chlorosis, Bronchial Catarrh, Catarrh of the Bladder, Chronic Uterine Discharges***, depending upon an enfeebled or relaxed state of the system.

It is sold by chemists generally.

E. FOUGERA & CO.'S

MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of **Ether; Chloroform; Oil of Turpentine; Apiol;**
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

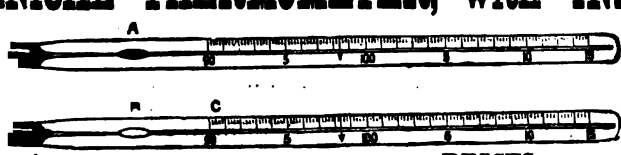
Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Pharmacien, No. 40 Rue Bonaparte, Paris,
without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in traveling, can possibly

to it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $6 00
also offer:
No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 3 50

t free by mail on receipt of price. Manufactured by L. CASELLA, London.

THIRTY-SIXTH SESSION.—1877-78.

FACULTY OF MEDICINE.

REV. HOWARD CROSBY, D.D.,
Chancellor of the University.

ALFRED C. POST, M.D., LL.D.,
Professor Emeritus of Clinical Surgery; President of the Faculty.

CHARLES INSLEE PARDEE, M.D.,
Prof. of Diseases of the Ear; Dean of the Faculty.

JOHN C. DRAPER, M.D., LL.D.,
Professor of Chemistry

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine.

WILLIAM DARLING, A.M., M.D., F.R.C.S.,
Professor of Anatomy.

WILLIAM H. THOMSON, M.D.,
Professor of Materia Medica and Therapeutics.

J. W. S. ARNOLD, M.D.,
Professor of Physiology and Histology.

JOHN T. DARBY, M.D.,
Professor of Surgery.

J. WILLISTON WRIGHT, M.D.,
Professor of Obstetrics and Diseases of Women and Children.

FANEUIL D. WEISSE, M.D.,
Professor of Practical and Surgical Anatomy.

JOSEPH W. WINTER, M.D.,
Demonstrator of Anatomy.

POST-GRADUATE FACULTY.

D. B. ST. JOHN ROOSA, M.D.,
Professor of Ophthalmology.

WM. A. HAMMOND, M.D.,
Professor of Diseases of the Mind and Nervous System.

STEPHEN SMITH, M.D.,
Professor of Orthopædic Surgery.

J. W. S. GOULEY, M.D.,
Professor of Diseases of the Genito-Urinary System.

MONTROSE A. PALLEN, M.D.,
Professor of Gynæcology.

HENRY G. PIFFARD, M.D.,
Professor of Dermatology.

A. E. MACDONALD, M.D.,
Professor of Medical Jurisprudence.

JOSEPH W. HOWE, M.D.,
Clinical Professor of Surgery.

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 19, 1877, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Third of October, 1877, and end about the 1st of March, 1878.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals, with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted to *all the Clinics* given therein, *free of charge.*

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Demonstrator's fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	30 00

For further particulars and circulars, address the Dean,

Prof. CHAS. INSLEE PARDEE, M.D.,

University Medical College, 410 East 26th St., New York City.

UNIVERSITY OF VERMONT.

MEDICAL DEPARTMENT,

BURLINGTON, VT.

TWENTY-FIFTH SESSION, 1878.

FACULTY OF MEDICINE.

MATTHEW HENRY BUCKHAM, A.M., D.D., BURLINGTON, VT., President.
SAMUEL WHITE THAYER, M.D., LL.D., BURLINGTON, VT., Emeritus Professor of General and Special Anatomy; Consulting Surgeon to Mary Fletcher Hospital.
WALTER CARPENTER, M.D., BURLINGTON, VT., Professor of the Theory and Practice of Medicine; Physician-in-Chief to Mary Fletcher Hospital.
JOHN ORDRONAUX, M.D., LL.D., NEW YORK CITY, Emeritus Professor of Medical Jurisprudence.
WILLIAM DARLING, A.M., M.D., F.R.C.S., NEW YORK CITY, Professor of General and Special Anatomy.
A. F. A. KING, M.D., WASHINGTON, D. C., Professor of Obstetrics and Diseases of Women; Consulting Physician to Mary Fletcher Hospital.
HENRY D. HOLTON, M.D., BRATTLEBORO, VT., Professor of Materia Medica and General Pathology; Consulting Surgeon to Mary Fletcher Hospital.
MARSHALL CALKINS, A.M., M.D., SPRINGFIELD, MASS., Professor of Physiology and Microscopic Anatomy.
JAMES L. LITTLE, M.D., NEW YORK CITY, Professor of the Principles and Practice of Surgery; Surgeon-in-Chief to Mary Fletcher Hospital.
GEORGE S. SMYTH, Ph.D., University Professor of Chemistry and Toxicology.

PROFESSORS OF SPECIAL SUBJECTS.

WILLIAM A. HAMMOND, M.D., NEW YORK CITY, Professor of Diseases of the Mind and Nervous System.
ROBERT W. TAYLOR, M.D., NEW YORK CITY, Professor of Diseases of the Skin.
A. P. GRINNELL, M.D., BURLINGTON, VT., Professor of Diseases of the Heart and Lungs; Attending Physician to Mary Fletcher Hospital.
STEPHEN M. ROBERTS, M.D., NEW YORK CITY, Professor of Diseases of Children.
A. T. WOODWARD, M.D., BRANDON, VT., Professor of the Surgical Diseases of Women; Consulting Physician to Mary Fletcher Hospital.
EDWARD S. PECK, A.M., M.D., BURLINGTON, VT., Professor of Diseases of the Eye and Ear.

LEROY M. BINGHAM, M.D., BURLINGTON, VT., Demonstrator of Anatomy; Attending Surgeon to Mary Fletcher Hospital.

THIS Medical College is situated near the University buildings, and upon an eminence overlooking the city of Burlington, Lake Champlain, and the Adirondack chain of mountains. For beauty of scenery and salubrity of climate its situation is not surpassed by any Institution of learning in the country. The building is of brick, well ventilated, and provided with two commodious lecture-rooms and amphitheatre, two large well lighted dissecting-rooms, and in every way perfectly adapted for clinical and scholastic teaching. It contains a large museum, composed of a great number of Osteological and Vascular preparations, both wet and dry, and is open to the students during the session.

HOSPITAL ADVANTAGES. The Mary Fletcher Hospital, now in progress of erection, will probably be ready to receive patients before the next regular session.

Clinical instruction in Medicine, Obstetrics, and Surgery, will be given during the regular course of lectures, by the Professors of the Medical Department of the University.

THE REGULAR WINTER SESSION will commence on the first Thursday of March, 1878, and continue sixteen weeks. This course will consist of from five to six Lectures daily, in the various Departments of Medicine and Surgery.

In order to render the course of instruction still more complete, six new Professorships on special subjects have been created by the Faculty since the close of the last session, which will afford the student a rare opportunity for gaining information from gentlemen well known as recognized authorities in their particular departments on subjects of great practical interest. These lectures will be delivered during the regular session.

CLINIQUES. Besides these Lectures, there will be Cliniques held as follows:

SURGICAL CLINIQUE, by Prof. LITTLE, every Saturday, from 9 to 12, during the last half of the Session.
MEDICAL CLINIQUE, by Prof. CARPENTER, on Wednesday morning, during the first half of the term.
CLINIQUE FOR DISEASES OF EYE AND EAR, by Prof. PECK, during his course of Lectures
CLINIQUE FOR DISEASES OF SKIN, by Prof. TAYLOR, during his course.
CLINIQUE FOR DISEASES OF CHILDREN, by Prof. ROBERTS.
CLINIQUE FOR DISEASES OF NERVOUS SYSTEM, by Prof HAMMOND, during his course of Lectures.

FEES FOR THE REGULAR SESSION.

Matriculation Fee, Payable each Term,	$5.00
Fees for the full Course of Lectures by all the Professors,	70.00
Graduation Fee,	25.00

Material for dissection will be furnished at cost.

The tickets are to be taken out at the beginning of the Session.

Students who have already attended two full courses of lectures in other regular schools, are admitted on paying the Matriculation fee and $25.

Students who have attended two full courses in this College, or who, having attended one full course in some regularly established medical school and one full course in this College, are admitted to a third course of lectures on paying the matriculation fee only.

GRADUATES of this school are admitted without fee. GRADUATES of other regular schools, and *Theological Students*, are admitted on general ticket, by paying the matriculation fee.

Good Board can be obtained at reasonable rates.

For further particulars and circular, apply to the Secretary,

Prof. A. P. GRINNELL, M.D., Burlington, Vt.

BELLEVUE HOSPITAL
MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DORHMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M. D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMITH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

See Advertisement of New Formu as in last week's issue, page 5.

McKESSON & ROBBINS' GRANULES, Gelatine-Coated.

Aconitia	1-60 gr.
Arsenious Acid	1-50, 1-40, 1-30, 1-20 gr.
Atropia	1-60 gr.
Belladonna Extract	1-4 gr.
Calcium, Sulphide	1-10 gr.
Codeia	1-16, 1-5 gr.
Corrosive Sublimate	1-40, 1-30, 1-20 gr.
Digitalia	1-60 gr.
This is prepared in our own laboratory and can be confidently relied upon.	
Mercury, Bin-Iodide	1-25, 1-16 gr.
